Sepsis & enterocolitis in neutropenic critically ill patient

Djamel Mokart,MD,PhD
Réanimation médico-chirurgicale
DAR, Institut Paoli-Calmettes, Marseille

Febrile Neutropenia : definitions

- Neutrophils <1500/mm^3
  - Profound neutropenia: neutrophils < 500/mm^3
  - Severe neutropenia: neutrophils < 100/mm^3
- Expected decrease of neutrophil count <500/mm^3 within the next 48 hours
- Functional neutropenia
  - AL at diagnosis or with hyper-leucocytosis
- Prolonged neutropenia(>7 days)
- Fever: oral temperature ≥ 38.3° C or ≥ 38° C ≥ 1 hour

SYSTEMATIC REVIEW

Changes in critically ill cancer patients' short-term outcome over the last decades: results of systematic review with meta-analysis on individual data

Michaël Darmon[1,2,3*], Aurélie Bourmaud[2,4,5], Quentin Georges[6], Marcio Soares[7], Kyeongman Jeon[8], Sandra Oeyen[9], Chin Kook Rhee[10], Pascale Gruber[11], Marlies Ostermann[12], Quentin A. Hill[13], Pieter Depuydt[9], Christelle Ferra[14], Anne-Claire Toffart[15], Peter Schellongowski[16], Alice Müller[17], Virginie Lemiale[1], Djamel Mokart[18] and Elie Azoulay[1,2,3]

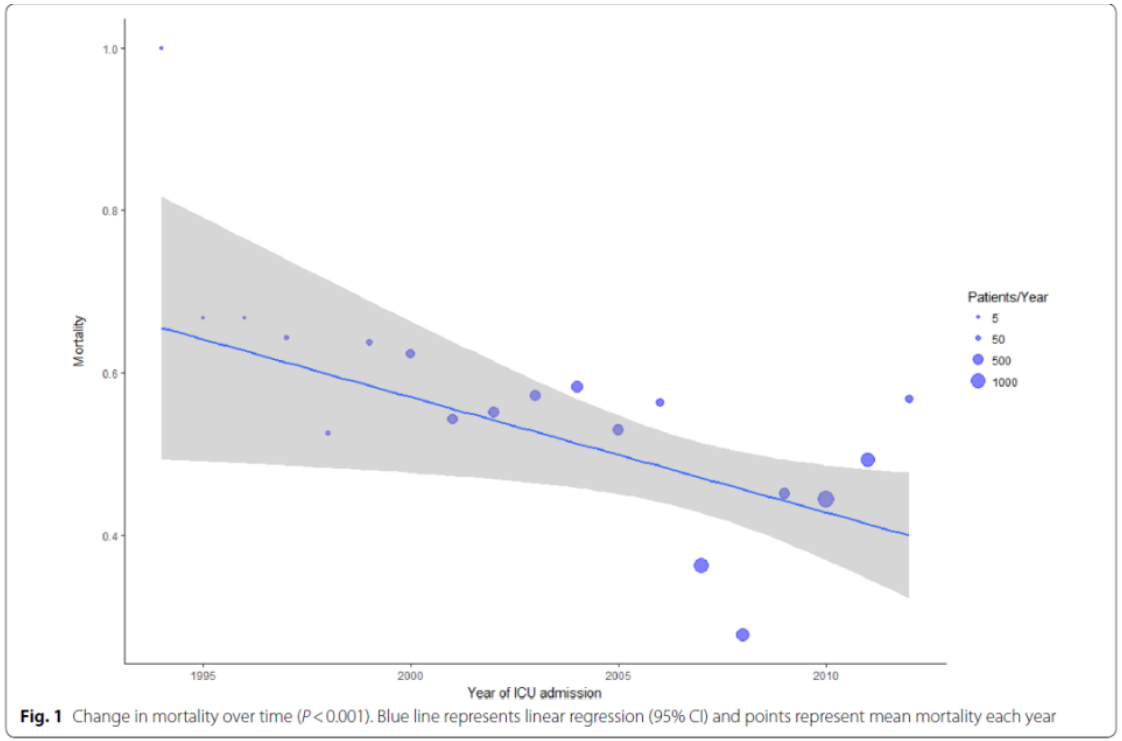

Fig. 1 Change in mortality over time ($P < 0.001$). Blue line represents linear regression (95% CI) and points represent mean mortality each year

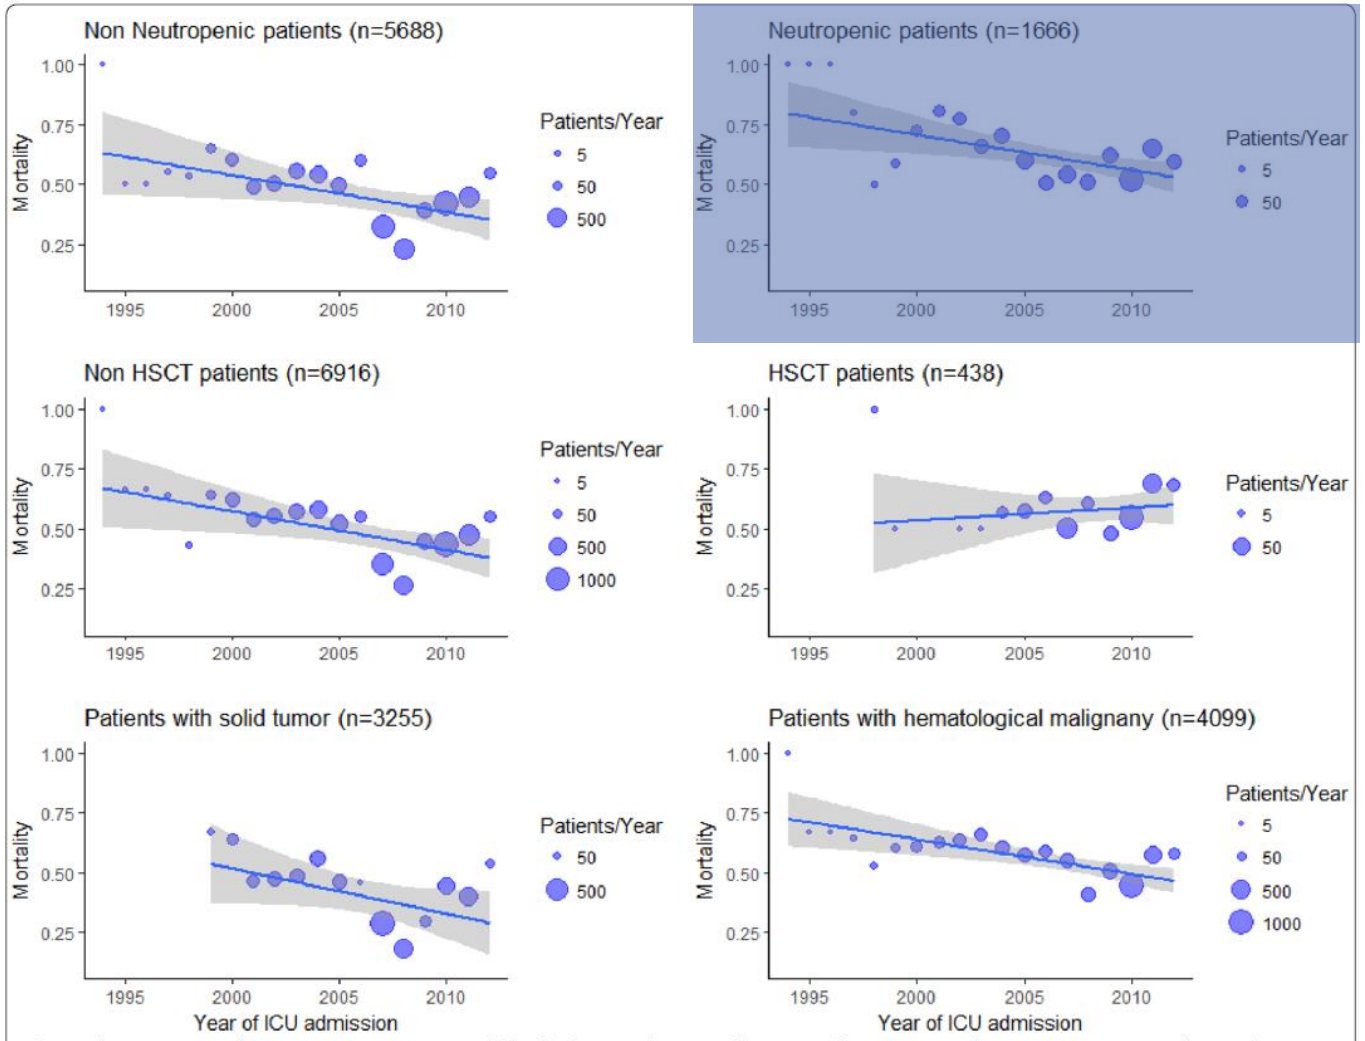

Fig. 3 Change in mortality over time in various predefined subgroup ($P < 0.001$ for every subgroup except hematopoietic stem cell transplant recipients $P = 0.21$). Blue line represents linear regression (95% CI) and points represent mean mortality each year and are weighted for number of observation each year

Acute respiratory failure in immunocompromised adults

Elie Azoulay, Djamel Mokart, Achille Kouatchet, Alexandre Demoule, Virginie Lemiale

Immunological deficiency	Neutrophils	Monocytes/dendritic cells/ macrophages	B lymphocytes	T lymphocytes	Humoral (antibody) immunity
Diseases	Acute leukaemia; myelodysplastic syndrome; aplastic anaemia; chemotherapy and drug-related neutropenia	Hairy cell leukaemia; aplastic anaemia; allogeneic bone marrow transplant; malignant histiocytosis; acute myeloid leukaemia; chronic myeloid leukaemia; solid tumours; haemophagocytic lymphohistocytosis	Multiple myeloma; B-cell lymphoma; chronic lymphocytic leukaemia	T-cell leukaemia; T-cell lymphoma; Hodgkin disease	Multiple myeloma; chronic lymphoid leukaemia
Treatments	Chemotherapy-induced neutropenia	Steroids; basiliximab; antithymocyte globulin; tacrolimus; mycophenolate mofetil; belatacept	Chemotherapy; steroids; asplenia; rituximab	Steroids; fludarabine; cyclophosphamide; methotrexate; azathioprine; alemtuzumab; mycophenolate mofetil; cyclosporine; mTOR inhibitors (sirolimus); tacrolimus; 2-chlorodeoxyadenosine; daratumumab	Ibrutinib; rituximab; daratumumab; cyclophosphamide
Most frequently encountered infections	• Gram-negative bacteria • Gram-positive bacteria • *Candida* • *Aspergillus* • *Nocardia*	• Non-tuberculous mycobacteria • *Salmonella, Listeria, Legionella, Histoplasma, Brucella* • Herpes simplex virus, varicella zoster virus, parainfluenza virus, respiratory syncytial virus • *Candida parapsilosis* • *Staphylococcus aureus, Enterococcus faecalis, Pseudomonas aeruginosa*	• Encapsulated bacteria (*Streptococcus pneumoniae, Streptococcus pyogenes, Haemophilus influenzae*) • *Giardia lamblia, Campylobacter, Salmonella* • *Mycoplasma* • Enterovirus • Recurrent infections	• Herpes simplex virus, cytomegalovirus, Epstein-Barr virus • *Pneumocystis, Aspergillus, Cryptococcus* • Mycobacterial infection • Skin candidiasis • Diarrhoea (rotaviruses, adenoviruses, *Cryptosporidium*, microsporidia, etc) • John Cunningham virus	• Encapsulated bacteria (*S pneumoniae, S pyogenes, H influenzae*) • *Mycoplasma, Ureaplasma urealyticum* • Other infections related to associated T-cell defects

Figure 2: **Risk for specific pathogens according to the type of haematological malignancy or treatment**
This figure illustrates the most frequently encountered types of infection according to the main disease-related or treatment-related immunological deficiency. It focuses mainly on secondary immunosuppression in adults, as data for primary immune deficiencies are scarce.

Neutropenic cancer patients with severe sepsis: need for antibiotics in the first hour.

Mokart D, Saillard C, Sannini A, Chow-Chine L, Brun JP, Faucher M, Blache JL, Blaise D, Leone M.

Table 1 Multivariate analysis of independent factors associated with ICU mortality

ICU mortality	Odds ratio	95 % confidence interval	*p*
Efficacy of the first antimicrobial treatment in the ICU			
Appropriate	1	Reference	
Inappropriate	6.4	1.6–26	0.01
Empirical	0.7	0.2–2.5	0.63
SOFA score at admission (per point)	1.4	1.2–1.6	<0.001
Non-fermentative Gram-negative bacilli	4.8	1.3–18	0.02
Interval between the first signs of sepsis in ICU and antimicrobial initiation >1 h	10	2.5–33	0.002

ICU intensive care unit, *SOFA* sequential organ failure assessment

Intensive Care Med. 2014 Aug;40(8):1173-4

Initial empirical antibiotic treatment

IDSA GUIDELINES

Table 1 Empiric antibiotic therapy in high risk patients with neutropenic fever (adapted from the IDSA guidelines [4])

Antibiotherapy	Indications	Grade of recommendation
Antipseudomonal β-lactam agent - Carbapenem (meropenem or imipenem-cilastatin) Piperacillin-tazobactam	All high risk patients with neutropenic fever	A-I
Aminoglycosides	Hemodynamic instability	B-III
Vancomycin		A-I
Vancomycin, linezolid or dapto		B-III
Linezolid or daptomycin		B-III
Carbapenem	gram negative bacteria	B-III
Polymyxin-colistin or tigecycline	Risk of Klebsiella pneumonia carbapenemase (KPC)	C-III
- Ciprofloxacin + clindamycin - Aztreonam + vancomycin	Penicillin-allergic patients	A-II

RFE SRLF/SFAR :
β-lactam active on pseudomonal with anti-gram-positive activity

Legrand et al. Annals of Intensive Care 2011, 1:22

Anti-pseudomonal beta-lactams for the initial, empirical, treatment of febrile neutropenia: comparison of beta-lactams (Review)

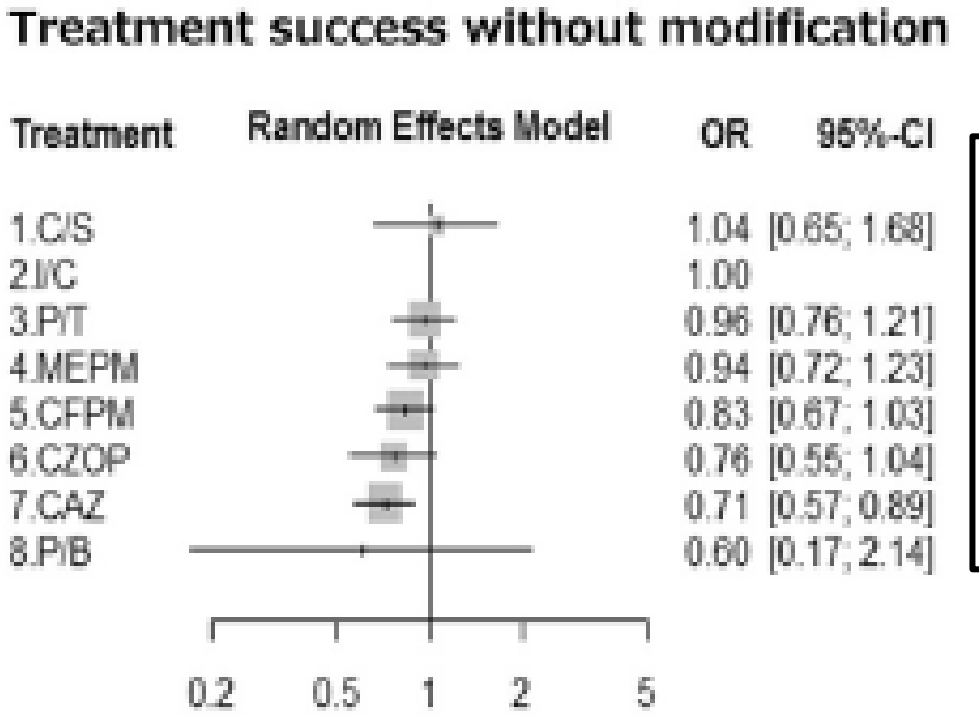
Paul M, Yahav D, Bivas A, Fraser A, Leibovici L

- 44 RCT, patient neutropénique fébrile
  - Comparison of one antipseudomonas beta-lactam vs another (1988-2010)
  - With or without glycopeptide
- All-cause mortality was significantly higher with **cefepime** as compared with other antibiotics, RR 1.39 [1.04, 1.86], 21 trials, 3471 participants
- All-cause mortality was lower with **piperacillin-tazobactam** versus all other antibiotics , RR 0.56 [0.34, 0.92], 8 trials, 1314 participants
- **Ceftazidime** vs others: NS
- **Carbapenem** vs others: NS
  - Fewer therapeutic failures or antibiotic modifications
  - More Clostridium difficile diarrhoea

Cochrane Database Syst Rev. 2010 Nov 10;(11):CD005197

Comparison of antipseudomonal β-lactams for febrile neutropenia empiric therapy: systematic review and network meta-analysis

N. Horita [1,*,3], Y. Shibata [1,3], H. Watanabe [1], H. Namkoong [2], T. Kaneko [1]



Among the recommended anti-pseudomonal β –lactams

- **Imipenem**
- **Piperacilline/tazobactam**
- **Meropenem**

- **Cefepime**
- **Ceftazidime**

Fig. 2. Forest plots for key findings. Abbreviations: C/S, cefoperazone/sulbactam; CAZ, ceftazidime; CFPM, cefepime; CZOP, cefozopran; I/C, imipenem/cilastatin; MEPM, meropenem P/B, panipenem/betamipron; P/T, piperacillin/tazobactam; OR, odds ratio.

Intitial cohort

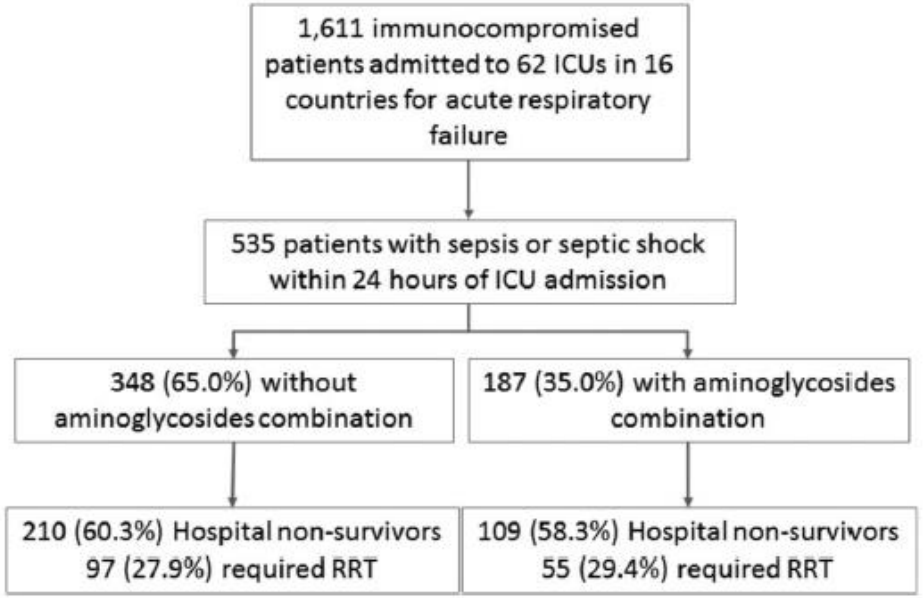

FIG. 1. **Patients' flowchart modified from EFRAIM study (17).**

TABLE 2. **Results of the multivariable mixed regression model with center effect on subsequent mortality risk.**

	Variable of interest: hospital mortality		
	Odds ratio	95% CI	*P* value
Fixed effect			
Performance status			
ECOG 0	*Reference*	–	–
ECOG 1	*1.30*	*0.68–2.47*	*0.43*
ECOG 2	*2.45*	*1.26–4.78*	*0.009*
ECOG 3	*5.55*	*2.61–11.80*	*<0.001*
Solid organ transplant	0.46	0.21–0.99	0.48
Renal replacement therapy	2.84	1.66–4.85	<0.001
Aminoglycosides	**1.14**	**0.69–1.89**	**0.61**
Model discrimination and calibration			
C-stat AUC (95% CI)		0.73 (0.68–0.77)	
Hosmer-Lemeshow-X^2		8.995	0.34

ECOG indicates Eastern Cooperative Oncology Group performance status (19).

Matched cohort 154 vs 154

TABLE 3. **Results of the multivariable mixed regression model with center effect on subsequent mortality risk in propensity score matched cohort.**

	In-hospital mortality		
	Odds ratio	Confidence interval	*P* value
Fixed effect			
D1 Oxygenation modality			
High Flow nasal Oxygen	*Reference*	–	–
Noninvasive ventilation	*1.39*	*0.39–4.91*	*0.61*
Standard oxygen	*0.48*	*0.18–1.28*	*0.14*
Invasive MV	*0.76*	*0.28–2.06*	*0.59*
Aminoglycosides	**0.89**	**0.49–1.61**	**0.69**
Model discrimination and calibration			
C-stat AUC (95% CI)		0.72 (0.68–0.77)	
Hosmer-Lemeshow-X^2		26.248	0.001

MV indicates mechanical ventilation.

Beta-lactam versus beta-lactam-aminoglycoside combination therapy in cancer patients with neutropenia (Review)

Paul M, Dickstein Y, Schlesinger A, Grozinsky-Glasberg S, Soares-Weiser K, Leibovici L

THE COCHRANE COLLABORATION®

published in Issue 2, 2014

- 71 RCT (1983-2012)
  - Reduced overall mortality in the monotherapy group(RR 0.87, 95% CI 0.75 to 1.02,ns)
  - Reduced infection-related mortality in the monotherapy group (RR 0.80, 95% CI 0.64 to 0.99).
  - Similar bacterial superinfections in the 2 groups
  - More fungal superinfections in the aminoglycoside group
  - More side-effects in the aminoglycoside group
    - Nephrotoxicity +++

Empirical antibiotics targeting gram-positive bacteria for the treatment of febrile neutropenic patients with cancer (Review)

Beyar-Katz O, Dickstein Y, Borok S, Vidal L, Leibovici L, Paul M

- 14 RCTs, 2782 épisodes (2012-2017)
  - BL vs the same BL +anti GPB (or equivalent)
- No difference in terms of mortality (8 RCTs)
- Failure of empirical treatment (11RCTs)
  - More changes in the monotherapy arm (11RCTs)
  - Reduced failures if GPB documentation (5RCTs)
  - Overall same failure rate (7RCTs)
- No increase in fungal superinfections in the anti GPB arm
- No more nephrotoxicity
- Reduced superinfection with GPB in the anti-GPB arm

Cochrane Database of Systematic Reviews 2017, Issue 6. Art. No.: CD003914.

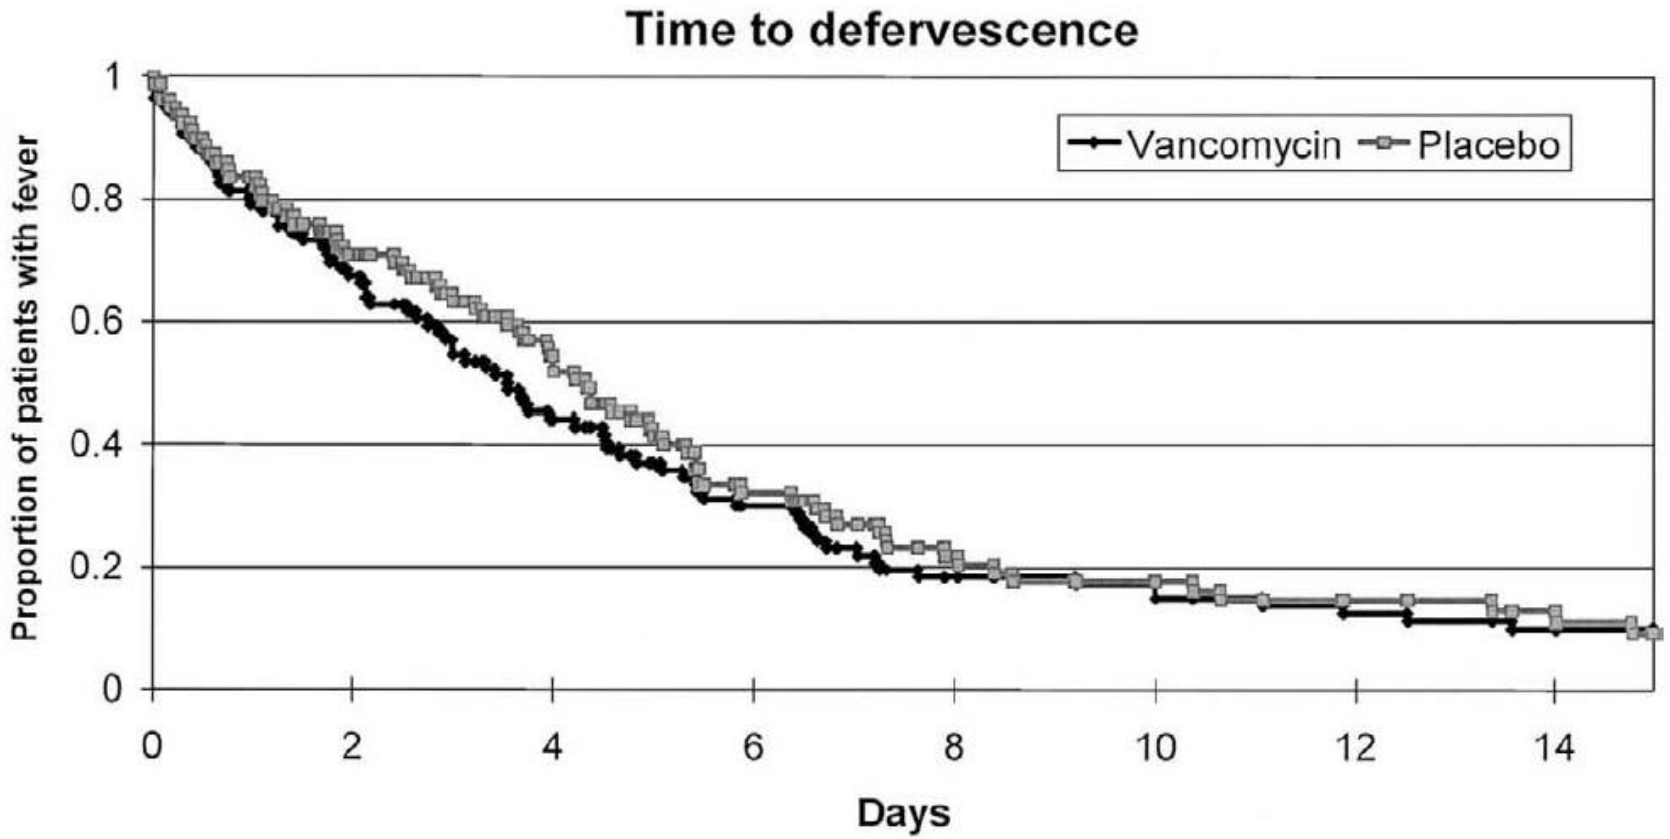
Gaya,[10] A. Padmos,[11] J. Klastersky,[4] S. Zinner,[12] M. P. Glauser,[1] T. Calandra,[1] and C. Viscoli,[13] for the International Antimicrobial Therapy Group of the European Organization for Research Treatment of Cancer[a]



Clinical Infectious Diseases 2003; 37:382–9

Efficacy and Safety of Linezolid Compared with Vancomycin in a Randomized, Double-Blind Study of Febrile Neutropenic Patients with Cancer

Branimir Jaksic,[1] Giovanni Martinelli,[2] Jaime Perez-Oteyza,[3] Charlotte S. Hartman,[4] Linda B. Leonard,[4] and Kenneth J. Tack[4]

Table 3. Clinical outcome at 7 days after the completion of therapy (i.e., at the test of cure assessment).

Population, presentation	No. of successes/no. of patients assessed (%)[a]		95% CI, %[b]	P[c]
	Linezolid group	Vancomycin group		
ITT	219/251 (87.3)	202/237 (85.2)	−4.1 to 8.1	.52
Primary malignancy				
Leukemia	119/143 (83.2)	111/138 (80.4)	−6.2 to 11.8	.55
Lymphoma	63/71 (88.7)	56/62 (90.3)	−12.0 to 8.8	.77
Myeloma	24/24 (100)	23/24 (95.8)	−3.8 to 12.2	.31
Tumor	11/11 (100)	11/12 (91.7)	−7.3 to 24.0	.33
Other	2/2 (100)	1/1 (100.0)	Not calculable	
Type of infection				
Fever of uncertain origin	72/78 (92.3)	66/74 (89.2)	−6.1 to 12.3	.51
Bacteremia of unknown source	59/72 (81.9)	53/67 (79.1)	−10.3 to 16.0	.67
Vascular catheter–related infection	23/27 (85.2)	24/28 (85.7)	−19.2 to 18.1	.96
Skin and soft-tissue infection	19/21 (90.5)	14/17 (82.4)	−13.9 to 30.2	.46
Pneumonia	19/23 (82.6)	13/15 (86.7)	−27.2 to 19.1	.74
Urinary tract infection	2/2 (100)	2/3 (66.7)	−20.0 to 86.7	.36
Other	25/28 (89.3)	30/33 (90.9)	−16.7 to 13.5	.83
MITT	55/63 (87.3)	43/50 (86.0)	−11.4 to 14.0	.84
Clinically evaluable	171/185 (92.4)	158/177 (89.3)	−2.8 to 9.1	.30
Microbiologically evaluable	41/47 (87.2)	32/37 (86.5)	−13.8 to 15.3	.92

Comparable efficiency
Linezolid
- Longer recovery from neutropenia
- Reduced time to defervescence
- Less renal failure

Vancomycin Plus Piperacillin-Tazobactam and Acute Kidney Injury in Adults: A Systematic Review and Meta-Analysis

Megan K. Luther, PharmD[1–3]; Tristan T. Timbrook, PharmD, MBA, BPCS[1,2]; Aisling R. Caffrey, PhD, MS[1–4]; David Dosa, MD, MPH[3,4]; Thomas P. Lodise, PharmD, PhD[5]; Kerry L. LaPlante, PharmD, FCCP[1–4]

Advances in antibacterial treatment of adults with high-risk febrile neutropenia

Adrien Contejean [1,2,3]*, Alexis Maillard [2], Etienne Canouï [2], Solen Kernéis[3,4,5], Bruno Fantin[3,6], Didier Bouscary[3,7], Perrine Parize [8], Carolina Garcia-Vidal[9,10] and Caroline Charlier [2,3,11,12]

Table 4. Main antimicrobial stewardship interventions to consider in patients with febrile neutropenia

Clinical situation	Intervention	References
Fever of unknown origin	Consider stopping antibiotics after at least 3 days of treatment and 48 h of apyrexia	9,10,120–124
CDI or MDI with no severity criteria	Consider the same treatment duration as in non-neutropenic patients if the patient gets at least 4 days of apyrexia and clinical and microbiological resolution Consider de-escalation to targeted therapy against documented bacteria	9,10,25,120,121,123,124
Fever persistence or breakthrough under broad-spectrum antibiotics AND no new clinical sign AND no severity criteria AND no MDR bacteria colonization	Do not consider antibiotic escalation	9,10,120,121
Ongoing combination of anti-Gram-positive and anti-*P. aeruginosa* β-lactam antibiotics and no microbiological documentation at Day 3	Consider stopping anti-Gram-positive antibiotics and pursuing only anti-*P. aeruginosa* β-lactam	9,10,120,121
Ongoing carbapenem AND no microbiological documentation at Day 3 AND patient is stable	Consider de-escalation to a narrower-spectrum β-lactam covering *P. aeruginosa*	10,120,121
Ongoing aminoglycosides	Consider stopping aminoglycosides at Day 2 or 3 when patient is stable	10,120,121
Pneumonia or cutaneous cellulitis	Consider tailored-fit treatment based on bronchoscopy and broncho-alveolar lavage samples	120
Initial severity criteria or corticosteroids	Sometimes excluded from published local guidelines Consider tailored-fit treatment	120,121

CDI, clinically documented infection; MDI, microbiologically documented infection.

Advances in antibacterial treatment of adults with high-risk febrile neutropenia

Adrien Contejean [1,2,3]*, Alexis Maillard [2], Etienne Canouï [2], Solen Kernéis[3,4,5], Bruno Fantin[3,6], Didier Bouscary[3,7], Perrine Parize [8], Carolina Garcia-Vidal[9,10] and Caroline Charlier [2,3,11,12]

Table 1. Main pharmacological modifications of antibiotics in febrile neutropenia

Pharmacological modifications	Involved antibiotics	References
Increase in volume of distribution	β-Lactams[a] Glycopeptides Daptomycin Aminoglycosides	57–65
Increase in drug clearance and decrease in elimination half-life	β-Lactams[a] Glycopeptides Daptomycin Aminoglycosides	57–65
Decrease in peak concentration (C_{max})	Daptomycin Aminoglycosides	63–65
Decrease in AUC	Glycopeptides Daptomycin	61–63
Decrease in post-antibiotics effect	Carbapenems Aminoglycosides	66,67

[a]Ceftolozane/tazobactam and ceftazidime/avibactam have not been specifically studied in patients with febrile neutropenia.

Advances in antibacterial treatment of adults with high-risk febrile neutropenia

Adrien Contejean [1,2,3]*, Alexis Maillard [2], Etienne Canouï [2], Solen Kernéis[3,4,5], Bruno Fantin[3,6], Didier Bouscary[3,7], Perrine Parize [8], Carolina Garcia-Vidal[9,10] and Caroline Charlier [2,3,11,12]

J Antimicrob Chemother 2023; **78**: 2109–2120

Table 2. Proposed dosage and infusion modalities of parenteral antibiotics in patients with high-risk febrile neutropenia and no otherwise specified condition

Antibiotics	Infusion modalities	Administration rules	Stability	Therapeutic drug monitoring	References
Piperacillin/ tazobactam	4 g loading dose over 30 min 12 g/day CI	Dilution in saline serum C_{max} 80 mg/mL + 10 mg/mL	24 h at 25°C	Piperacillin concentration at steady state (≥24 h)	76,78–80
Cefepime	2 g loading dose over 30 min 6 g/day CI	Dilution in saline serum C_{max} 50 mg/mL Administration in three separate infusions over 8 h	8 h at 25°C	Cefepime concentration at steady state (≥24 h)	78–83
Ceftazidime	2 g loading dose over 30 min 6 g/day CI	Dilution in saline serum C_{max} 80 mg/mL Administration in three separate infusions over 8 h	8 h at 25°C	Ceftazidime concentration at steady state (≥24 h)	78–80,84
Meropenem	2 g loading dose over 30 min 6 g/day CI	Dilution in saline serum C_{max} 50 mg/mL Administration in three separate infusions over 8 h	8 h at 25°C	Meropenem concentration at steady state (≥24 h)	80,85,86
Vancomycin	25 mg/kg loading dose over 2 h (max. 2 g) 40 mg/kg/day CI	Dilution in saline serum or G5% C_{max} 40 mg/mL	48 h at 25°C	Vancomycin concentration at steady state (24 h after loading dose)	78,79,87–91
Daptomycin	10 mg/kg/day over 30 min	Dilution in saline serum C_{max} 500 mg/50 mL	12 h at 25°C	Efficacy: 24 h AUC/MIC or daptomycin concentration at peak (30 min after the end of infusion) Toxicity: daptomycin trough concentration, before subsequent infusion	63,79,92–95
Amikacin	30 to 35 mg/kg/day over 30 min	Dilution in saline serum or G5% C_{max} 20 mg/mL	24 h at 25°C	Efficacy: amikacin concentration at peak (30 min after the end of infusion) Toxicity: amikacin trough concentration, before subsequent infusion	64,65
Gentamicin	6 to 7 mg/kg/day over 30 min	Dilution in saline serum or G5% C_{max} 10 mg/mL	24 h at 25°C	Efficacy: gentamicin concentration at peak (30 min after the end of infusion) Toxicity: gentamicin trough concentration, before subsequent infusion	64,65,79

G5%, Glucose 5%.

Advances in antibacterial treatment of adults with high-risk febrile neutropenia

Adrien Contejean [1,2,3]*, Alexis Maillard [2], Etienne Canouï [2], Solen Kernéis[3,4,5], Bruno Fantin[3,6], Didier Bouscary[3,7], Perrine Parize [8], Carolina Garcia-Vidal[9,10] and Caroline Charlier [2,3,11,12]

Table 3. Clinical hypotheses if patient is still febrile at Day 3

Hypotheses	Complementary investigations
Underdosed antibiotics	Therapeutic drug monitoring
Inappropriate antibiotic therapy	Repeat blood cultures
Uncontrolled focal infection	Full body tomography
	Consider [^{18}F]FDG-PET-CT scan
	Therapeutic drug monitoring
	Consider central venous catheter withdrawal and culture
	Search for *Clostridioïdes difficile* infection
Thrombosis (+/− septic) of central venous catheter	Central catheter Doppler ultrasound
	Repeat blood cultures
Undocumented MDR bacteria	Repeat blood cultures
Insufficient antibacterial spectrum	
Viral infection	Nasopharyngeal swab with PCR test
(flu, respiratory syncytial virus, SARS-CoV-2, etc.)	
Invasive fungal infection	Sinus and chest tomography
(aspergillosis, mucormycosis, invasive candidiasis, etc.)	Galactomannan antigen
	Aspergillus sp. blood PCR
	Mucor sp. blood PCR
	β-D-Glucan
	Repeat blood cultures

Antibiotic Resistance in the Patient With Cancer: Escalating Challenges and Paths Forward

Amila K. Nanayakkara, PhD [1]; Helen W. Boucher, MD[2]; Vance G. Fowler, Jr, MD, MHS[3]; Amanda Jezek[4]; Kevin Outterson, JD, LLM[5,6]; David E. Greenberg, MD[1,7]

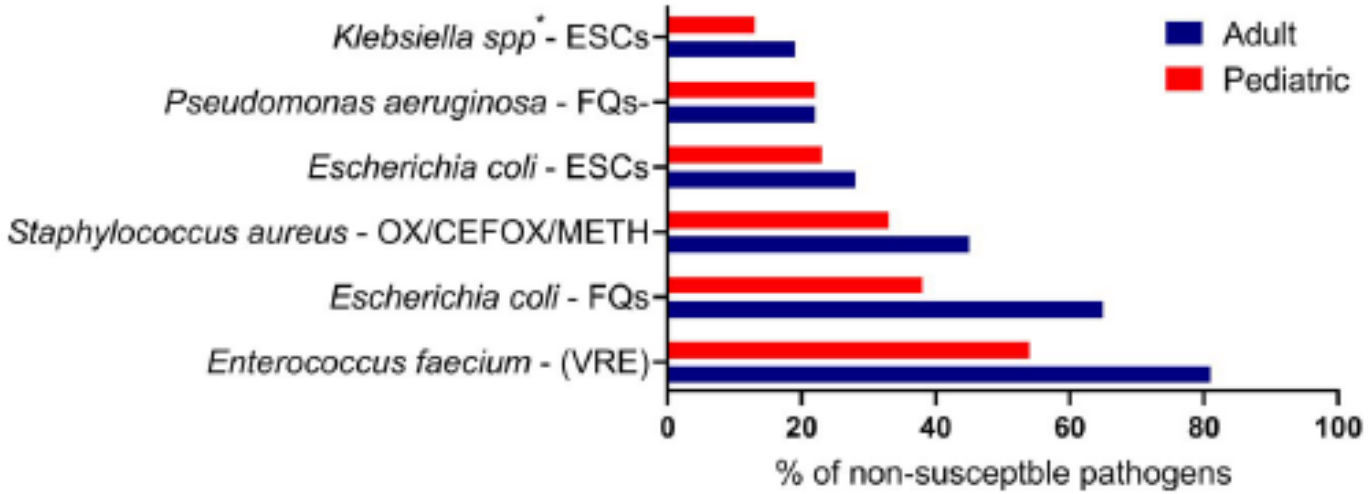

FIGURE 1. Antibiotic Resistance Is Common in Patients With Cancer. This bar graph displays the percentage of pathogens reported from adult and pediatric central line-associated bloodstream infections (CLABSIs) that tested nonsusceptible (NS) to selected antimicrobial agents in hospital oncology units in the United States from 2015 to 2017. Data for the graph were obtained from the National Healthcare Safety Network 2015 to 2017 adult and pediatric antibiotic resistance reports. **Klebsiella* spp. include *K. oxytoca* and *K. pneumoniae*. ESCs indicates extended-spectrum cephalosporins (cefepime, cefotaxime, ceftazidime, or ceftriaxone); FQs, fluoroquinolones (ciprofloxacin or levofloxacin); OX/CEFOX/METH, oxacillin, cefoxitin, or methicillin; VRE, vancomycin-resistant *Enterococcus*.

Carbapenem-resistant Enterobacteriaceae in special populations: Solid organ transplant recipients, stem cell transplant recipients, and patients with hematologic malignancies

Stephanie M. Pouch & Michael J. Satlin

Table 2. Mortality rates after Carbapenem-resistant Enterobacteriaceae (CRE) Infections in patients with hematologic malignancies and haematopoietic stem cell transplant (HSCT) recipients.

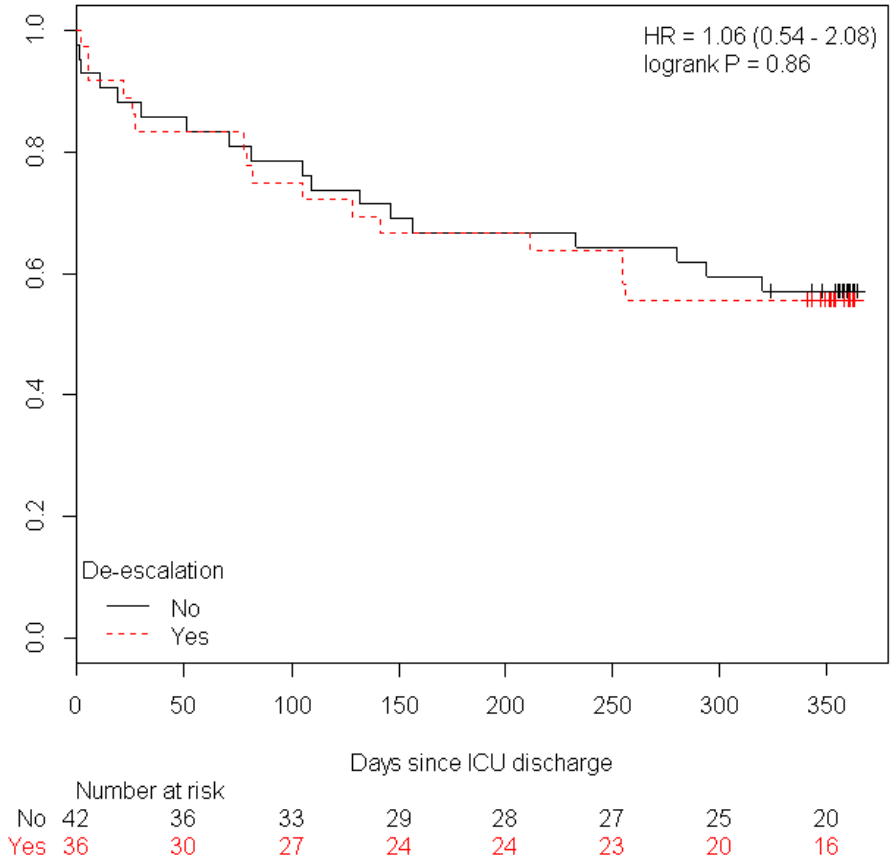
Jérôme Lambert
Antoine Sannini
Laurent Chow-Chine
Jean-Paul Brun
Pierre Berger
Ségolène Duran
Marion Faucher
Jean-Louis Blache
Colombe Saillard
Norbert Vey
Marc Leone

- **De-escalation rate = 40%**
- **Associated factors**
  - Adequation of the empirical antimicrobial treatment used in ICU [OR = 10.8 (95 % CI 1.20–96)] for adequate documented treatment versus appropriate empirical treatment
  - Compliance with guidelines regarding the empirical anti-pseudomonal betalactam used in ICU [OR = 10.8 (95 % CI 1.3–89.5)]



Intensive Care Med. 2014 Jan;40(1):41-9.

Neutropenic Enterocolitis, a Growing Concern in the Era of Widespread Use of Aggressive Chemotherapy

Lior Nesher and Kenneth V. I. Rolston

Table 1. Diagnostic Criteria for Neutropenic Enterocolitis[a]

Type of Criteria	Finding	Remarks
Major	Neutropenia	ANC $<500 \times 10^9$ cells/L
	Bowel wall thickening on CT exam or US exam	> 4 mm (transverse scan) thickening in any segment of the bowel for at least 30 mm length (longitudinal scan)
	Fever[b]	> 38.3 (oral or rectal)
Minor/nonspecific	Abdominal pain	> 3 on a visual analog scale (1–10)
	Abdominal distention	
	Abdominal cramping	
	Diarrhea	
	Lower GI bleeding	

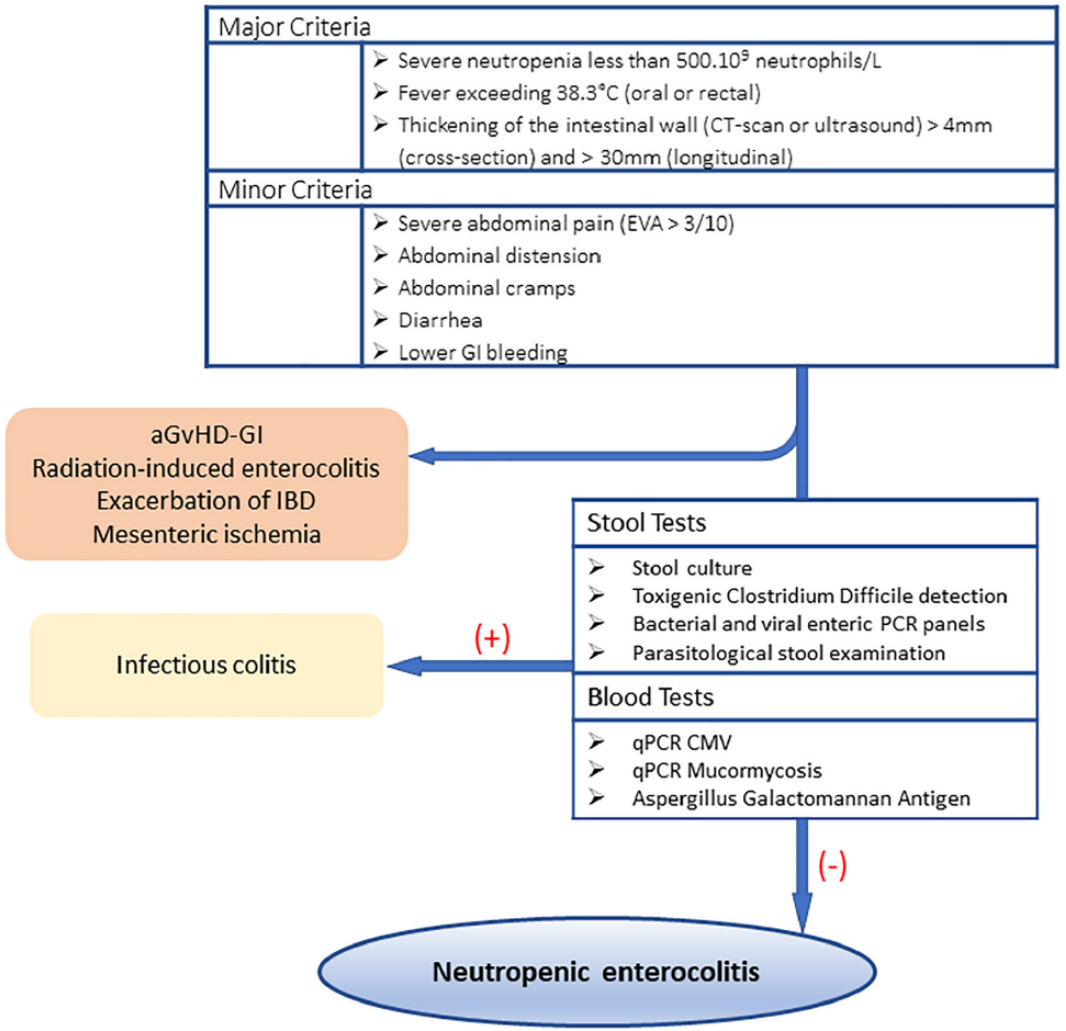
Abbreviations: ANC, absolute neutrophil count; CT, computerized tomography; GI, gastrointestinal; US, ultrasound.

[a] Adapted from Gorschluter et al [11].

[b] Fever may be absent in a minority of patients and some may even be hypothermic.

Recent advances in neutropenic enterocolitis: Insights into the role of gut microbiota

Natacha Kapandji [a,b,*], Elie Azoulay [a], Lara Zafrani [a]



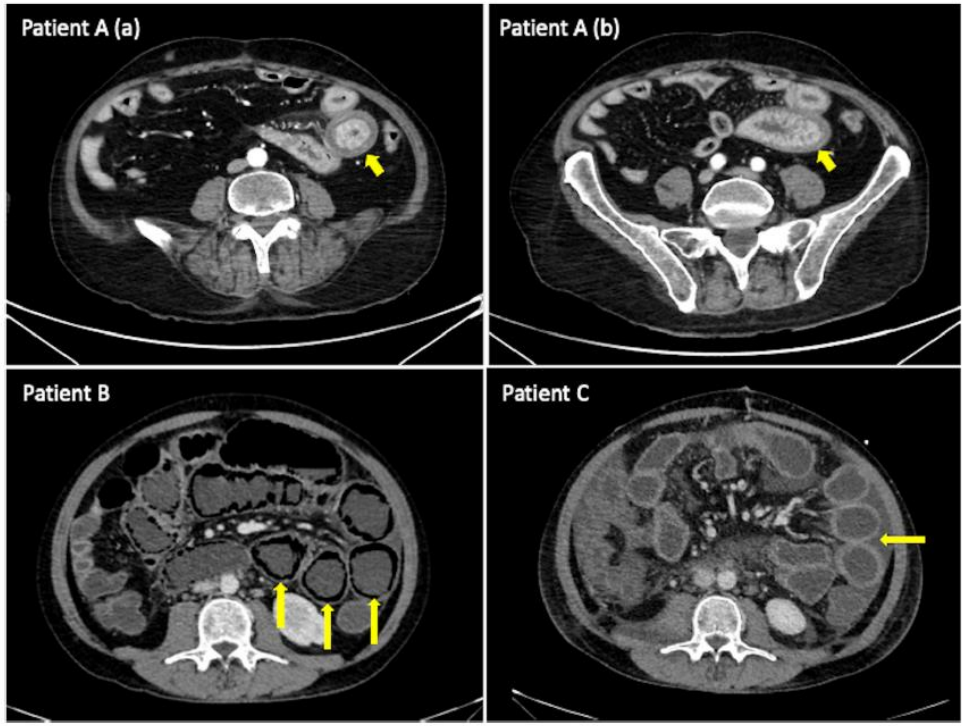


Fig. 2. Contrast enhanced abdominal CT-scans of neutropenic enterocolitis.
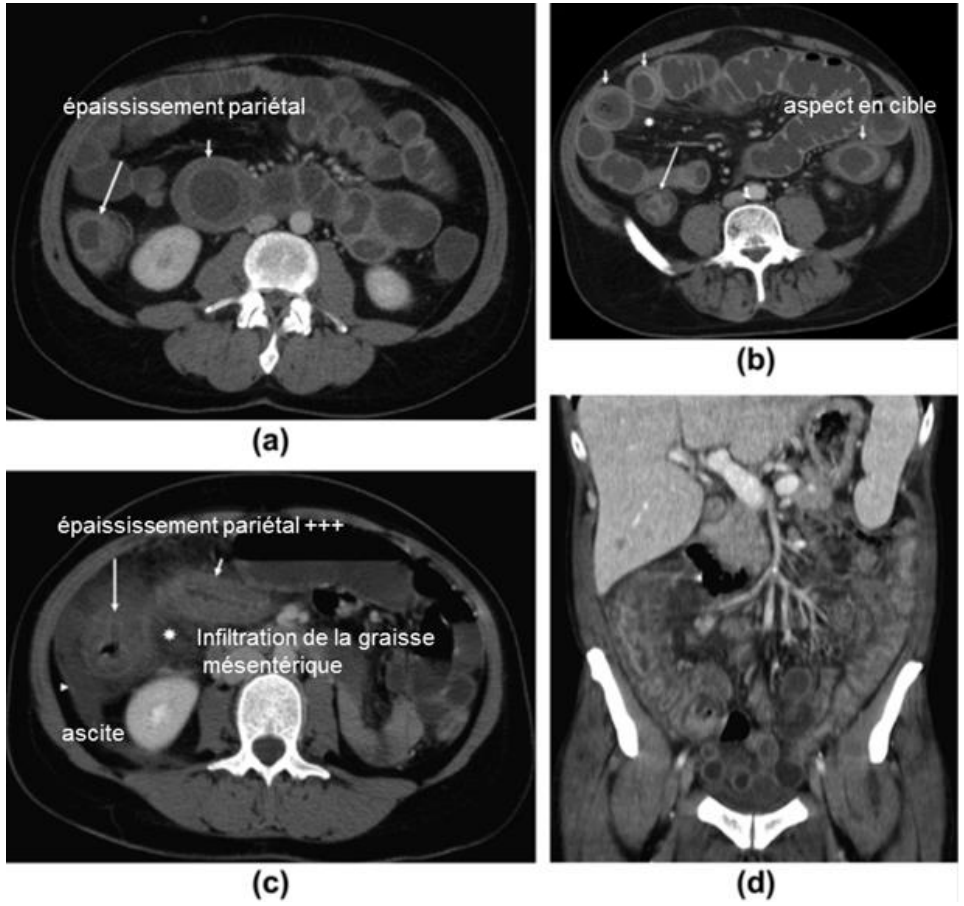
A: Segmental bowel wall thickening (→) with mucosal enhancement of the duodenum and the jejunum. a) Cross section (> 4 mm) b) Longitudinal section (>30 mm).
B: Parietal pneumatosis (→) with mucosal enhancement involving the entire digestive tract and no arterial thrombosis.
C: Peritoneal effusion (→) with bowel wall thickening and mucosal enhancement.

Kapandji, Blood Reviews 54 (2022) 100944

Parietal thickening: CT scan and ultrasound



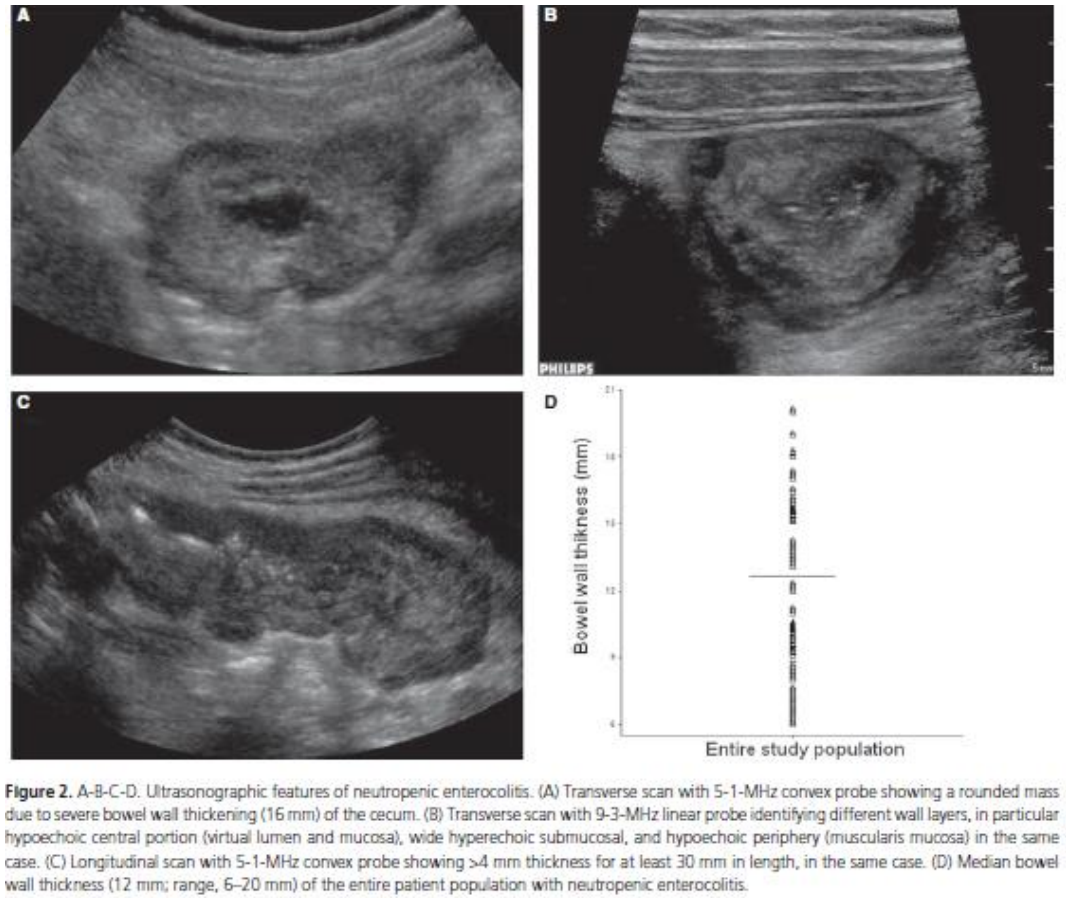


Figure 2. A-B-C-D. Ultrasonographic features of neutropenic enterocolitis. (A) Transverse scan with 5-1-MHz convex probe showing a rounded mass due to severe bowel wall thickening (16 mm) of the cecum. (B) Transverse scan with 9-3-MHz linear probe identifying different wall layers, in particular hypoechoic central portion (virtual lumen and mucosa), wide hyperechoic submucosal, and hypoechoic periphery (muscularis mucosa) in the same case. (C) Longitudinal scan with 5-1-MHz convex probe showing >4 mm thickness for at least 30 mm in length, in the same case. (D) Median bowel wall thickness (12 mm; range, 6–20 mm) of the entire patient population with neutropenic enterocolitis.

Pathophysiology

Multifactorial
- Neutropenia
  - Decreased local immunity
  - Microbial invasion
- Mucosal lesions (chemotherapy, radiotherapy)
  - Oedema, necrosis, ulcerations, etc.

Infiltration (leukaemia, lymphoma)
Intramural haemorrhage (thrombocytopenia),
Modification of intestinal flora:
- commensal -> opportunistic

Surgical treatment of acute abdominal complications in hematology patients: outcomes and prognostic factors

Djamel Mokart[a], Marion Penalver[a], Laurent Chow-Chine[a], Jacques Ewald[b], Antoine Sannini[a], Jean Paul Brun[a], Magali Bisbal[a], Bernard Lelong[b], Jean Robert Delpero[b], Marion Faucher[a] and Olivier Turrini[b]

Table 2. Etiology of acute abdominal syndrome.

Etiologies	Patients ($n = 58$)	Clinical picture
No cause	1 (1.7)	
Primary peritonitis	2 (3.4)	
Tumoral infiltration	12 (20.7)	10 Digestive lymphomas with gastrointestinal perforations (among them 3 peritonitis), 2 splenic infiltrations (lymphoma, ALL) with haemorraghic shock
Digestive GVHD	2 (3.4)	1 Sigmoid stenosis, 1 gastrointestinal perforation with peritonitis
Neutropenic enterocolitis	3 (5.2)	2 Gastrointestinal perforations, 1 colonic necrosis with peritonitis
Invasive digestive aspergillosis	3 (5.2)	3 Intestinal ischemiae, among them 1 peritonitis
Digestive bleeding	5 (8.6)	2 Intraluminal digestive bleeding related to thrombopenia, 1 intestinal ischemia, 1 spontaneous rupture of a liver subcapsular hematoma, 1 choledocal bleeding after percutaneous drainage, 1 intestinal bleeding in a context of cecum angiodysplasia
Appendicitis	2 (3.4)	1 Appendicular abscess, 1apendicular peritonitis
Cholecystitis	3 (5.2)	2 Gangrenous cholecystis, 1biliary peritonitis
Sigmoïditis	8 (13.8)	8 Peritonitis with digestive perforation
Gastrointestinal obstruction	8 (13.8)	7 Patients with occlusion of small intestine caused by adherences (with 1 digestive perforation with peritonitis), 1 patient with Ogilvie syndrome (colonic pseudo-obstruction)
Mesenteric ischemiae	2 (3.4)	
Others	7 (12)	1 Colonic perforation after biopsy, 1 gastric ulcer perforation, 1 intestinal perforation with peritonitis secondary to a foreign body, 1 pelvic abscess, 2 intestinal perforations of unknown origin with peritonitis, 1 pseudomembranous colitis with peritonitis

GVHD: graft versus host disease. Variables were reported as numbers and percentages, *n* (%).

LEUKEMIA & LYMPHOMA, 2017
http://dx.doi.org/10.1080/10428194.2017.1296145

Prevalence(s)

Between 0.8 and 46%, probably underestimated

- Nesher, CID,2013

5.3% of cancer patients hospitalised and treated with CT

- Gorschlüter, Eur J Haematol, 2005

17% of neutropenic patients admitted to the ICU

- Mokart,ICM, 2015

33% of cancer patients admitted to ICU for digestive emergencies

- Lebon, JCC, 2017

Gastrointestinal emergencies in critically ill cancer patients

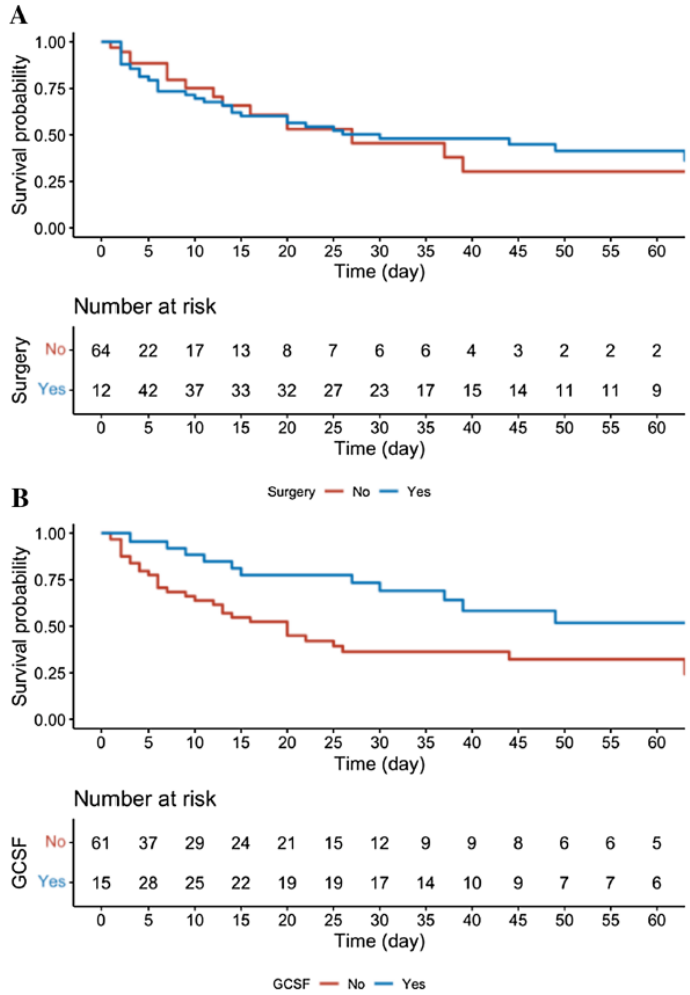
HR [95%CI]: hazard ratio [95% confidence interval]; aHR [95%CI]: adjusted hazard ratio [95% confidence interval]; G-CSF: granulocyte colony-stimulating factor; [a]Missing values in 4 patients have been imputed. **Bolded** values are significant at $p < 0.05$



Management of neutropenic enterocolitis: the place of surgery?

- Key points
  - Cure is associated with neutropenia recovery.
    - Role of medical treatment
  - Neutropenia (with or without thrombocytopenia) is not a contraindication to surgery.
- Indications for surgery
  - Perforation
  - Intestinal necrosis
  - Major colonic dilatation
  - Uncontrolled digestive hemorrhage
  - New or worsened organ failures

Conclusion

- Inflammatory response is particular and complex
- Clinical symptoms are time-dependent variables
- Infectious emergency
- ARF is associated with a poor outcome
- NE is associated with favourable outcome in ICU
