Timeline | Landmarks in TB control

ilk kombinasyon tedavisi

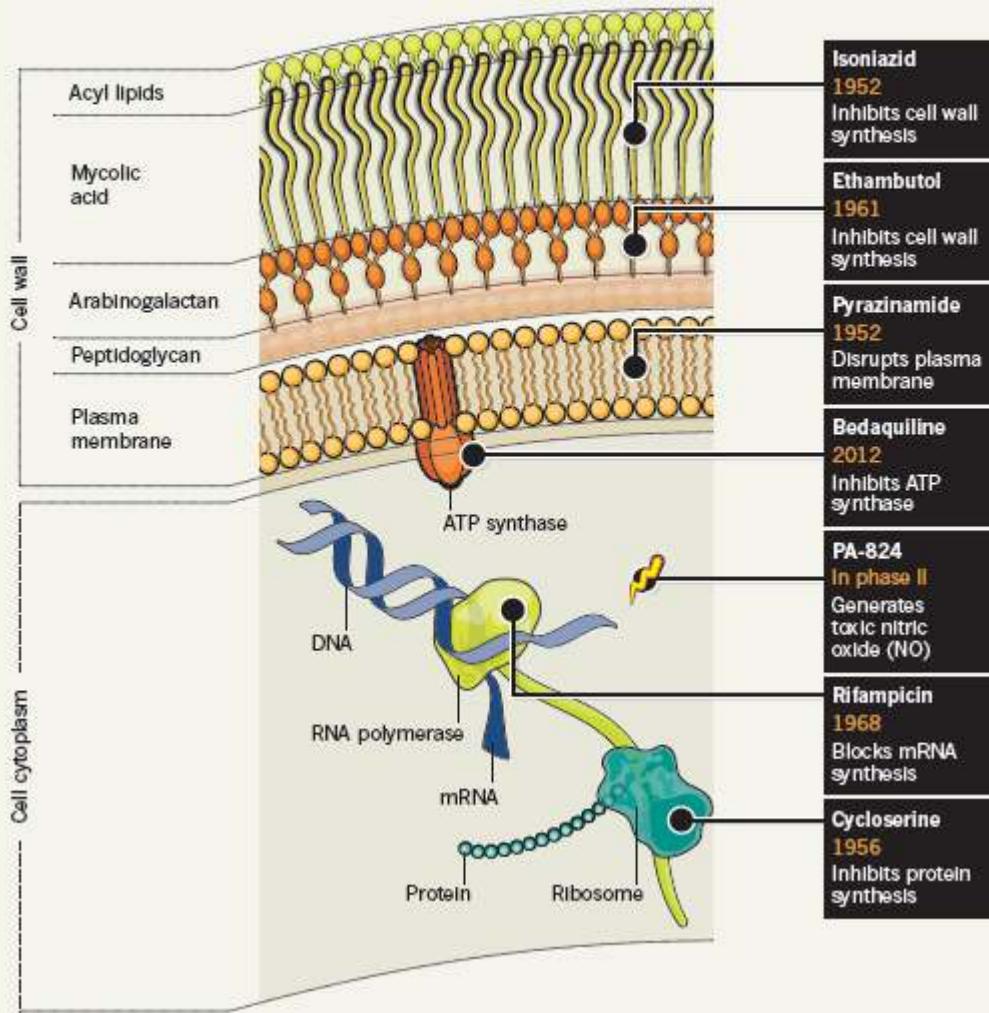

HRZE/ RIPE

Tedavi protokolü ve tedavide kullanılan ilaçlar çok hızlı değişmeyen bir hastalık

Lienhardt C, Glaziou P, Uplekar M, Lönnroth K, Getahun H, Raviglione M. Global tuberculosis control: lessons learnt and future prospects. Nature reviews microbiology volume 10 , june 2012, 407-416

HIT LIST

Anti-TB drugs attack *Mycobacterium tuberculosis* in different ways, so combining different drugs helps combat the bacterium developing ways to overcome a drug.

1968-Rifampisin
2012-Badaquiline
2016(?) -PA-824 (PII)

AD-TB Yaklaşım

- Konak tanımı yapılmalı
- Sendrom tanımlanmalı
- Mikrobiyolojik ekten gösterilmeli
- Tedavi seçenekleri ve ek tedavi modaliteleri değerlendirilmeli

Konak Tanımı?

- İmmün durum- özellikler HIV durumu
 - Primer TB riski daha yüksek
 - AD-TB tutulumu yüksek
 - Mortalite yüksek
 - Dirençli etken (MDR-TB veya XDR-TB) riski
- Erişkin /çocuk/ gebelik/emzirme
- Yaşadığı yer (bakımevi, hapishane vs)
- Komorbid hastalık (DM, KBY, Bağ doku hastalığı vs)

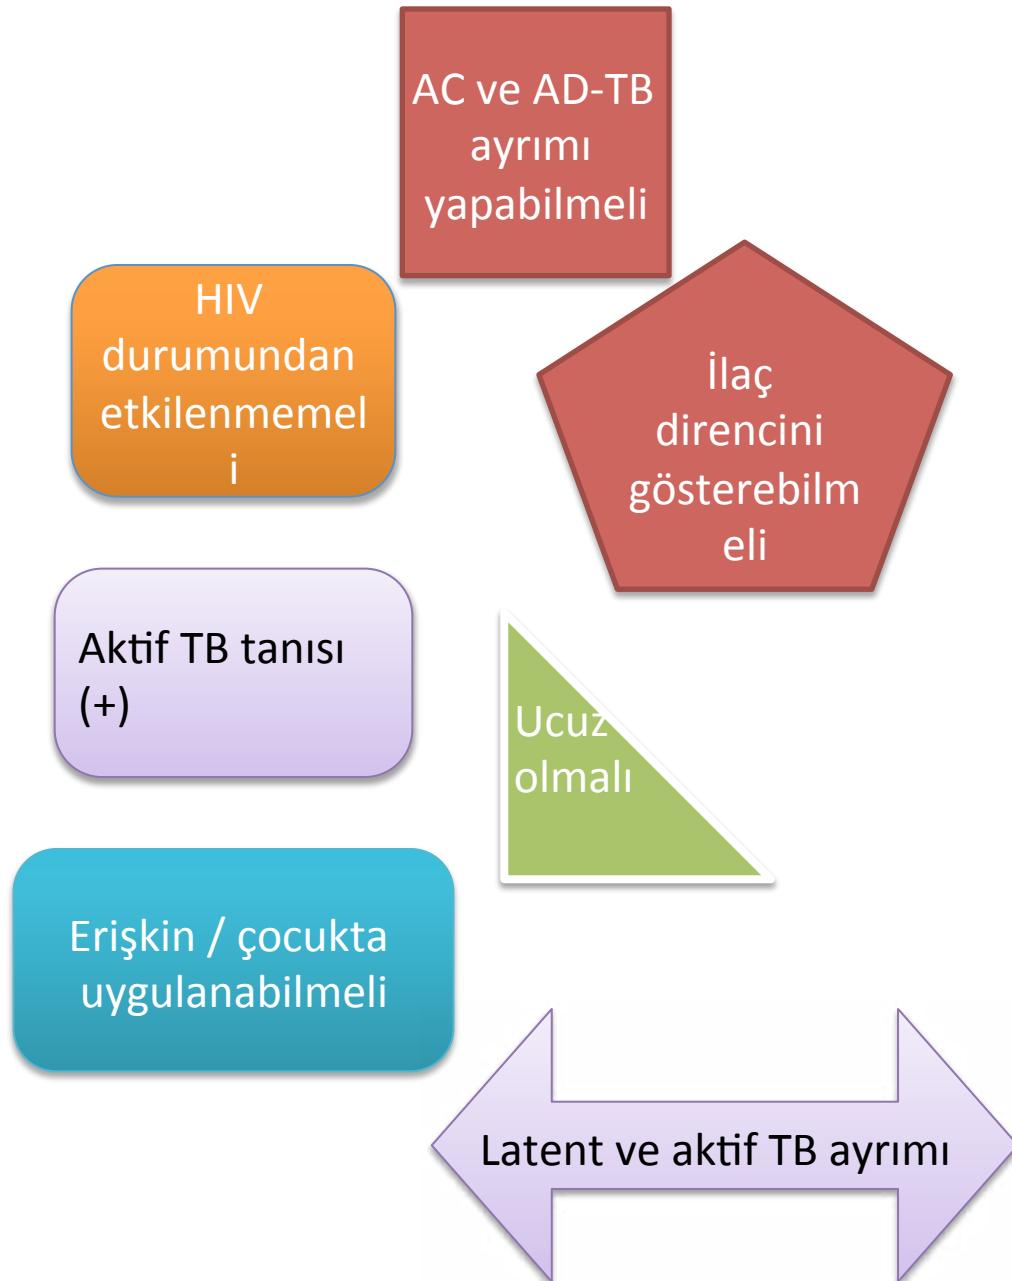

Sendrom Tanımı-enfeksiyon yeri?

- Pnömoni var mı? AC grf veya ek bulgular? Miliyer tutulum?
- AD-TB aranır; diğer organ tutulumları...
- Sorular ve sorunlar
 - ? Aktif TB var mı; miliyer tutulum
 - ? Yeni TB mu veya reaktivasyon TB
 - ? İlaç direnççi riski var mı veya daha önce tedavi almış
- Tüm bunların yanıtına göre tedavi **kİŞİSELLEŞTİRİLİR**

Mikrobiyolojik etken?

- ? Enfeksiyon mu veya enfeksiyon dışı enflamasyon mu
- ? Enfeksiyonsa TB dışında bir şey olabilir mi

İdeal TB-Mikrobiyoloji Testi?

Serolojik tanı testleri

- FDA onayı yok
- Güvenilirlik düşük,
- Sensitivite ve spesifite değişken
- Hatta yanlış tanı, gereksiz tedavi ile sonraki olası tedavileri etkiliyor (MDR/XDR TB)

Let Us Stop Malpractices in TB Diagnosis

Inaccurate Serological Blood Tests for Diagnosis of TB banned by the Government of India in Public Interest

**MINISTRY OF HEALTH AND FAMILY WELFARE
(Department of Health and Family Welfare)
NOTIFICATION
New Delhi, the 7th June, 2012**

G.S.R. 423(E) - Whereas the Central Government is satisfied that the use of the serodiagnostic test kits for diagnosis of tuberculosis are giving inaccurate and imprecise results leading to wrong diagnosis and their use is likely to involve risk to human beings and whereas safer alternatives are available;

And whereas the Central Government is satisfied that it is necessary and expedient to prohibit the manufacture, sale, distribution and use of the said test kits in public interest;

Now, therefore, in exercise of the powers conferred by Section 26A of the Drugs and Cosmetics Act, 1940 (35 of 1940), the Central Government hereby prohibit the manufacture for sale, distribution and use of the following test kits with immediate effect:

"Serodiagnostic test kits for diagnosis of tuberculosis"

Frequently asked questions on the notification:

Q. What is the reason behind the ban?
ANS: There is proven scientific evidence that serodiagnostic tests for TB provide inconsistent and imprecise results despite high claims of its accuracy.

**No More Deaths From TB
Together We Can Make India TB Free**

**Free Diagnosis and Treatment for TB is Available
For More Details Please Contact Concerned District TB Officer**

**REVISED NATIONAL TUBERCULOSIS CONTROL PROGRAM
Ministry of Health and Family Welfare, Government of India**

Q. Who is the consequence of inconsistent and imprecise results?
ANS: The dependence on such unreliable tests can be fatal as many patients will end up undergoing TB treatment without any need for it as they are wrongly diagnosed as TB. At the same time, the test also misses many TB patients thus denying treatment at the right time. Such patients will continue to suffer and even spread the infection to other healthy individuals.

Q. What is meant by "serodiagnostic test kits" for tuberculosis?
ANS: Serodiagnostic tests for tuberculosis are tests that detect the antibody response to tuberculosis-causing bacteria in blood samples of suspected tuberculosis patients.

Q. Is the ban applicable to Indian as well as imported TB serodiagnostic kits?
ANS: Yes, the ban is applicable to all kits manufactured in India as well as all types of importations.

Q. How can TB be detected if all blood tests have been banned? Are there any alternative tests available?
ANS: Government of India has approved the following tests for diagnosis of TB:

- Sputum examination under microscope
- Culture tests
- Newer molecular tests.

Q. What are Interferon-gamma release assays (IGRAs)?
ANS: IGRAs are laboratory blood test that measure the cell-mediated immune response of TB in infected individuals.

Q. In which situation should IGRA not be used?
ANS: IGRAs blood tests have limited use as they cannot differentiate between active pulmonary TB disease and latent TB infection. Hence IGRAs should not be used as stand alone tests to detect active TB disease.

Cerrahi vs İlaç (sure?)

Review

Drug treatment of multidrug-resistant osteoarticular tuberculosis: a systematic literature review

Inés Suárez-García ^{a,*}, Arturo Noguerado ^b

- 12 osteoartiküler TB
 - MDR-TB ,
 - 6 hasta spinal TB,
 - 6 hasta ekstra spinal TB,
 - 5 hastada cerrahi tedavisiz yanıt (+),
 - Toplam tedavi süreleri 18 ay ile 24 ay arasında değişiyor.
 - 1 hasta septisemiden ex

Conclusions: Osteoarticular MDR-TB is very infrequently reported in the literature. The few cases reviewed suggest that it is possible to achieve a good outcome with second-line anti-tuberculous drugs, and that surgery might be useful for cases in which an optimized medical treatment is not possible.

The treatment of spinal tuberculosis: a retrospective study

S. Ramachandran,* I. J. Clifton,* T. A. Collyns,† J. P. Watson,* S. B. Pearson*

- 1998-2002 arası İngiltere 42 kemik TB
 - 34 spinal TB, 8 diğer kemik TB
 - 38 (34 spinal TB, 4 kemik TB) hastanın kayıtlarına ulaşılmış,
 - 6 ay tedavi alanlarda (5/8)relaps
 - > 9 ay alan 30 hastada sıfır relaps

CONCLUSION: Six months of treatment, as currently recommended by the BTS, may be inadequate for bone TB, including spinal TB.

Unusual presentation of more common disease/injury**CASE REPORT****Glenohumeral joint tuberculosis with multiple cold abscesses: an uncommon cause of shoulder pain**Betul Kızıldag,¹ Alper Sener,² Erkam Komurcu,³ Ozan Karataş,¹ Sule Kosar¹**TREATMENT**

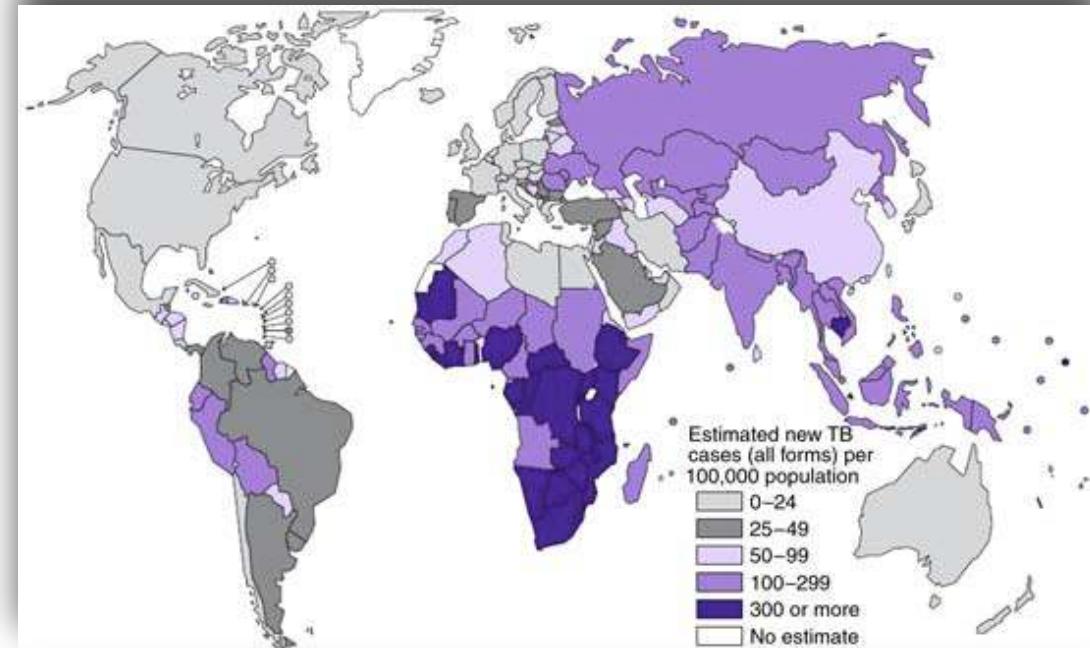

The patient was thought to have right shoulder tuberculous osteoarthritis and multiple cold abscess involving the right shoulder girdle muscles according to the MRI findings and anti-TB treatment was started. Isoniazid 300 mg, rifampicin 600 mg, ethambutol 1500 mg and morphazinamide hydrochloride 2500 mg were used for initial treatment. He was then hospitalised in the orthopaedic clinic for debridement on the 15th day after the start of treatment. Debridement was not considered due to the age of the patient and the cardiovascular risk. A total of 12 months of treatment with double anti-TB treatment was planned for the patient 2 months later.

Current Opinion in Infectious Diseases 2009,
22:490–495

Purpose of review

Intestinal tuberculosis (TB) is increasing due partly to the HIV pandemic. Its clinical presentation mimics inflammatory conditions such as Crohn's disease and malignancies, which are becoming more prevalent, so the diagnosis is problematic.

Recent findings

Greater awareness of intestinal TB is needed, both in countries where TB is endemic and developed countries with immigrant populations. Some strains of *Mycobacterium tuberculosis* are associated with more extrapulmonary disease and greater dissemination, thereby exacerbating the rise in HIV-associated extrathoracic TB. Recent

- 6HRZE veya 9 HRZE, DOTS'a göre daha başarılı,
- HAART tedavisi alanlarda R'siz rejim
- Anti-TNF alacaklarda öncesinde 3HR yada sırasında TB gelişirse 6HRZE,
- KSD, kullanımı net değil? Anti-TB tedaviye olumsuz etkisi yok
- Cerrahi tedavi üstünlük yok

Resistant to RFP only (<i>n</i> = 1)	1 (100)
MDR (<i>n</i> = 10)	10 (100)

NOTE. INH, isoniazid; MDR, multidrug resistant (organisms resistant to at least INH and RFP); RFP, rifampicin; SM, streptomycin.

- Tedavinin 9. ayda tüm duyarlılarda dahi mortalite %28,7
- MDR'lilerin tamamı ex
- Tüm gruptarda mortalite %33,3 (60/ 180)
- Kombine R ve H direnci; kötü klinik gidişle direkt ilişkili
- H ve/veya S direnci; bakterinin BOS'tan temizlenmesi ile ilişkili ancak klinik seyire etkisi yok,

ORIGINAL ARTICLE

Dexamethasone for the Treatment of Tuberculous Meningitis in Adolescents and Adults

Guy E. Thwaites, M.R.C.P., Nguyen Duc Bang, M.D., Nguyen Huy Dung, M.D., Hoang Thi Quy, M.D., Do Thi Tuong Oanh, M.D., Nguyen Thi Cam Thoa, M.D., Nguyen Quang Hien, M.D., Nguyen Tri Thuc, M.D., Nguyen Ngoc Hai, M.D., Nguyen Thi Ngoc Lan, Ph.D., Nguyen Ngoc Lan, M.D., Nguyen Hong Duc, M.D., Vu Ngoc Tuan, M.D., Cao Huu Hiep, M.D., Tran Thi Hong Chau, M.D., Pham Phuong Mai, M.D., Nguyen Thi Dung, M.D., Kasia Stepniewska, Ph.D., Nicholas J. White, F.R.C.P., Tran Tinh Hien, M.D., and Jeremy J. Farrar, F.R.C.P.

- 545 hasta; >14y SSS-TB, Vietnam, prospektif, randomize
 - 275 hasta dexametazone
 - 271 hasta placebo (KSD)
- 9 ay anti-TB tedavisi planlanmış
- Başlangıçta Dexametazone (eş zamanlı)
- Mortalite, morbidite, komplikasyon izlem

Table 1. Baseline Characteristics of the Study Population.

Variable	Dexamethasone (N=274)	Placebo (N=271)
Age — yr		
Median	36.0	35.0
Range	15–88	15–84
Male sex — no. (%)	168 (61.3)	163 (60.1)
Diagnosis at discharge — no. (%)		
Definite	98 (35.8)	89 (32.8)
Probable	130 (47.4)	131 (48.3)
Possible	44 (16.1)	47 (17.3)
Not tuberculous meningitis*	2 (0.7)	4 (1.5)
Duration of symptoms — days†		
Median	15	15
Range	4–90	2–90
Weight — kg		
Median	45.0	45.0
Range	25–75	30–70
Score on Glasgow coma scale‡		
Median	14	14
Range	3–15	3–15
Cranial nerve palsy — no. (%)	82 (29.9)	74 (27.3)
Hemiparesis — no. (%)	48 (17.5)	37 (13.7)
Paraparesis — no. (%)	28 (10.2)	11 (4.1)
MRC grade — no. (%)§		
I	90 (32.8)	86 (31.7)
II	122 (44.5)	125 (46.1)
III	62 (22.6)	60 (22.1)
HIV status — no. (%)		
Positive	44 (16.1)	54 (19.9)
Negative	227 (82.8)	209 (77.1)
Not tested	3 (1.1)	8 (3.0)
Lymphocyte count — per mm ³ ¶		
CD4 cells		
Median	64	66
Range	14–694	7–359
CD8 cells		
Median	606	386
Range	134–998	28–1001

Table 2. Outcome Nine Months after Randomization, According to Disease-Severity Grade and HIV Status.*

Outcome and Group	Dexamethasone	Placebo	Relative Risk (95% CI)	P Value
	no./total no. (%)			
Death				
All patients	87/274 (31.8)	112/271 (41.3)	0.69 (0.52–0.92)	0.01
Grade				
I	15/90 (16.7)	26/86 (30.2)	0.47 (0.25–0.90)	0.02
II	38/122 (31.1)	50/125 (40.0)	0.71 (0.46–1.1)	0.11
III	34/62 (54.8)	36/60 (60.0)	0.81 (0.51–1.29)	0.38
Relative risk of death stratified according to grade†			0.68 (0.52–0.91)	0.007
HIV status				
Negative	57/227 (25.1)	67/209 (32.1)	0.72 (0.51–1.02)	0.07
Positive	27/44 (61.4)	37/54 (68.5)	0.86 (0.52–1.41)	0.55
Undetermined	3/3 (100)	8/8 (100)	1.16 (0.71–1.91)	0.71
Relative risk of death stratified according to HIV status‡			0.78 (0.59–1.04)	0.08
		Dexamethasone	Placebo	Odds Ratio
		no./total no. (%)		P Value
Death or severe disability				
All patients	121/274 (44.2)	134/271 (49.4)	0.81 (0.58–1.13)	0.22
Grade				
I	19/90 (21.1)	30/86 (34.9)	0.50 (0.25–0.98)	0.04
II	57/122 (46.7)	61/125 (48.8)	0.92 (0.56–1.52)	0.74
III	45/62 (72.6)	43/60 (71.7)	1.05 (0.47–2.31)	0.91
Odds ratio stratified according to grade§			0.79 (0.56–1.13)	0.20
HIV status				
Negative	93/230 (40.4)	96/217 (44.2)	0.86 (0.59–1.25)	0.42
Positive	28/44 (63.6)	38/54 (70.4)	0.74 (0.32–1.72)	0.48
Undetermined	3/3 (100)	8/8 (100)	—	—
Odds ratio stratified according to HIV status¶			0.87 (0.62–1.24)	0.44

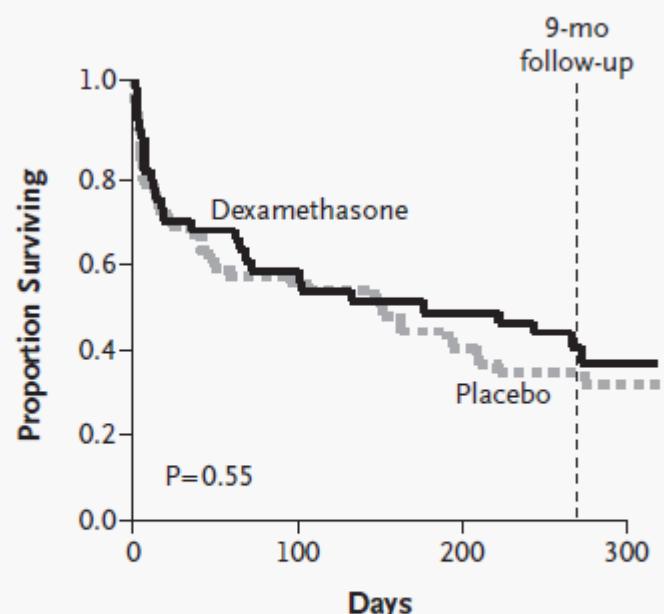

Dexametazone

- Evre I'de mortaliteyi azaltıyor (%17 vs %30)
- Evre II-III'de azaltıyor ama p anlamlı değil

Table 3. Outcomes of 545 Patients Nine Months after Randomization.

Group	No. of Patients	Outcome			
		Good	Inter- mediate	Severe Disability	Death
		number (percent)			
Dexamethasone*	274	104 (38.0)	49 (17.9)	34 (12.4)	87 (31.8)
Placebo	271	95 (35.1)	42 (15.5)	22 (8.1)	112 (41.3)

C Patients Infected with HIV

- 9. ay değerlendirmede
 - Steroid alan grupta kalıcı nörolojik hasarlar arasında fark yok
 - Mortalite azalmış ama anlamlı değil

- HIV (+) hastalarda dahi steroidin sağ kalım üzerine etkisi yok

*In relation to male patients.

NR, not reported.

- Tüm üriner sistem tutulur ancak en sık böbrekler
- Renal tutulum tek/ çift taraflı olabilir

- Hastaların nerdeyse yarısı ilerleyen dönemde cerrahi geçiriyor
- Gelişmiş ülkelerde daha sık
- Cerrahi tipi nefrektomi yada palyatif cerrahi
- Mesanede fibrozis nedeniyle büyültme operasyonları en sık (%8)
- Cerrahi anti-TB tedavinin 4-6.hfsında yapılmalı

Cerrahinin yeri?

- Tedavi sırasında gelişen hidrops

EAU Guidelines

EAU Guidelines for the Management of Genitourinary Tuberculosis

Mete Çek*, Severin Lenk, Kurt G. Naber, Michael C. Bishop, Truls E. Bjerklund Johansen, Henry Botto, Magnus Grabe, Bernard Lobel, Juan Palou Redorta, Peter Tenke

the Members of the Urinary Tract Infection (UTI) Working Group of the European Association of Urology (EAU) Guidelines Office

Department of Urology, Taksim Teaching Hospital, Istanbul, Turkey

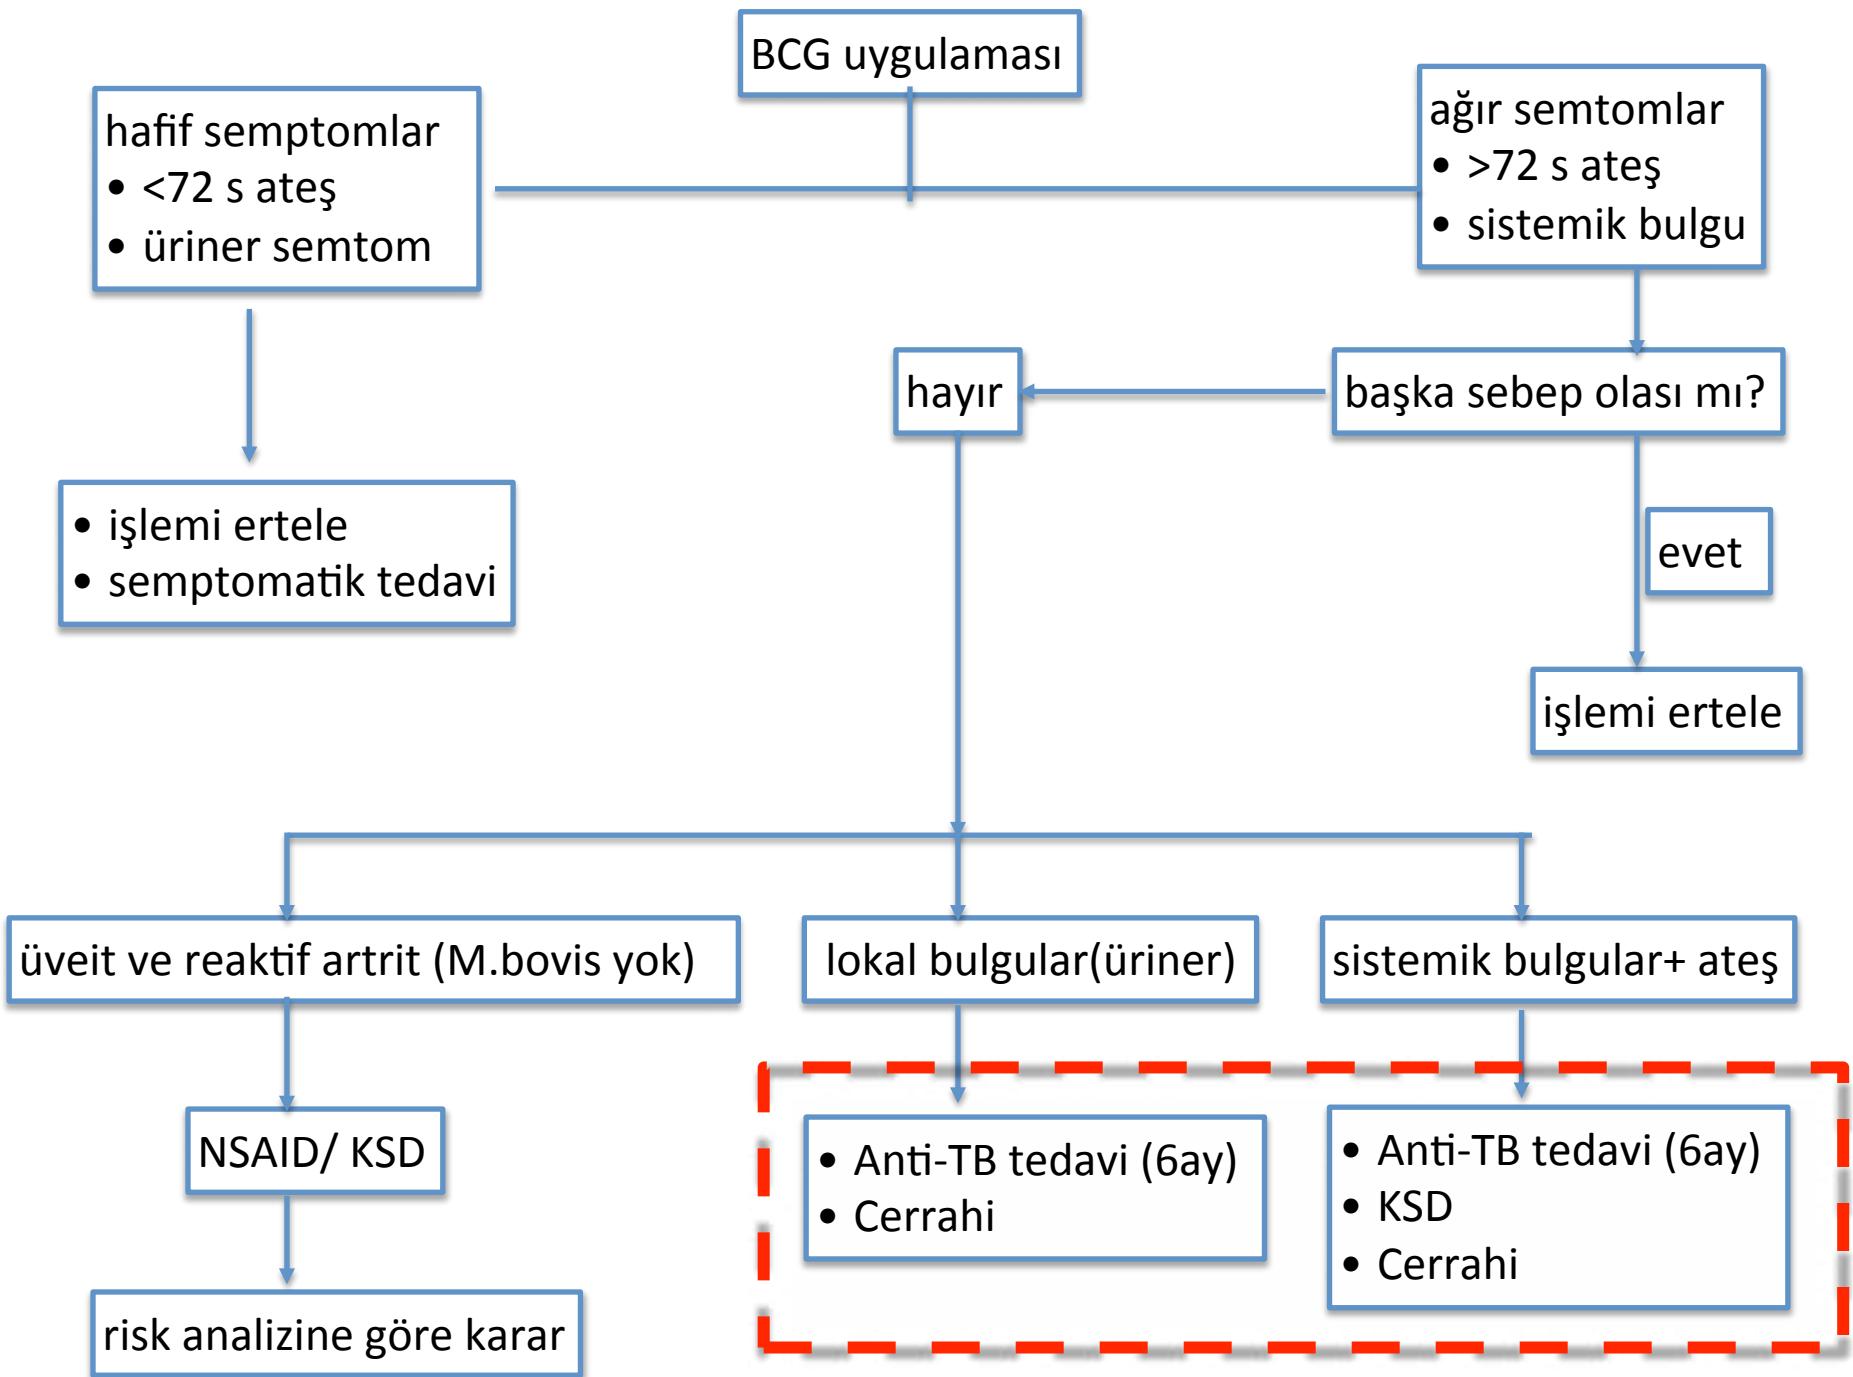

- Anti TB tedavi HRZE/S (2 ay), HR (4ay)
- Rekürrens, komplikasyon, HIV(+); 9-12 ay
- MDR-TB; duyarlılığa göre;>18 ay
- Cerrahi?

- Nefrektomi;
 - Nonfonksiyone böbrek (kalsifiye/değil)
 - Tüm böbrek tutulumu+HT/ üreteropelvik birleske tutulumu,
 - Beraberinde renal karsinom
- Parsiyel nefrektomi
 - 6 hafta anti-TB tedaviye rağmen kalsifikasyon içeren polar lezyon,
 - Takiple büyüyen/ böbreğin genelini tehdit eden kalsifikasyon,

- Abse drenajı
- Epidimektomi;
 - Anti TB tedaviye yanıt vermeyen kazefikiye abse,
 - Anti TB tedaviye rağmen sabit kalan yada büyüyen kitlesel lezyon
- Üreteral striktür
 - Ureteropelvik bileşke darlığı; double J kateter
 - Orta üreter darlığı;üreterostomi/ double J kateter
 - Alt ürter darlığı: anti-TB+KSD (<3 hf)+dilatasyon

Cardiovascular Topics

Surgical management of effusive constrictive pericarditis

FUAT BUYUKBAYRAK, ERAY AKSOY, SERPIL TAS, KAAN KIRALI

- Effüzyonlu konstrüktif perikardit
 - 12 hasta(5 idiyopatik, 4 TB, 3 malignite),
 - 10 hastaya perikardiyosentez başarısız,
 - 1 hasta acil, 9 hasta elektif perikardiektomi,
 - post op takip 3 ay-9 yıl,
 - mortalite 5 hasta (%41,6),

TABLE 5. RESULTS OF PERICARDIAL TISSUE BIOPSY AND FOLLOW-UP DATA

Pat- ient	Aetiol- ogy	Date of opera- tion	Intensive care unit stay	Pericardial biopsy	Follow up (months)	Outcome
1	ID	2004	8 days, LCOS, RF, RDS	Non-specific inflammation	4.04	Death from pneumonia + sepsis
2	TB	2004	1 day, uneventful	Granulomatous inflammation	95.0	NYHA class I
3	MG	2005	7 days, LCOS, RF, RDS	Neoplastic involvement [†]	2.9	Death from disease progression
4	MG	2005	2 days, uneventful	Neoplastic involvement [‡]	19.7	Death from disease progression
5	TB	2006	8 days, re-operation for bleeding, RF, RD	Granulomatous inflammation	79.9	NYHA class III
6	ID	2006	6 days, re-operation for bleeding, RF, RD	Non-specific inflammation	25.7	Death from advanced HF
7	MG	2007	2 days, uneventful	Neoplastic involvement [§]	25.6	Death from disease progression
8	TB	2007	8 days, LCOS, RD	Non-specific inflammation	66.4	NYHA class II
9	ID	2007	1 day, uneventful	Non-specific inflammation	62.5	NYHA class I
10	ID	2008	5 days, low-dose inotrope	Non-specific inflammation	51.3	NYHA class I
11	TB	2008	2 days, uneventful	Granulomatous inflammation	48.2	NYHA class II
12	ID	2012	3 days, low-dose inotrope	Non-specific inflammation	8.9	NYHA class II

ID: idiopathic, TB: tuberculous, MG: malignancy, LCOS: low-cardiac output syndrome, RF: renal failure, RD: respiratory distress, NYHA: New York Heart Association, HF: heart failure.

[†]Neoplastic cell invasion without definitive diagnosis,

[‡]Pericardial involvement of malignant mesothelioma (epitolid type),

[§]Pericardial involvement of high-grade diffuse B-type cell lymphoma.

- TB hastalarında erken cerrahi sonuçları iyi,
- Anti TB tedavi yanında KSD tedavisi uygulanmamış,

Seminar

Pericarditis

Richard W Troughton, Craig R Asher, Allan L Klein

Bakteriyel enfeksiyonlar
içinde en sık ekten TB

Cause of acute pericarditis

Idiopathic

Infections

Bacterial, tuberculous, viral (coxsackie, influenza, HIV, etc), fungal, rickettsial, mycoplasma, leptospiral, listeria, parasitic, and others

Vasculitis and connective-tissue disease

Rheumatoid arthritis, rheumatic fever, systemic lupus erythematosus, scleroderma, Sjögren's syndrome, Reiter syndrome, ankylosing spondylitis, Wegener's granulomatosis, giant-cell arteritis, polymyositis (dermatomyositis), Behcet's syndrome, familial Mediterranean fever, dermatomyositis, polyarteritis, Churg-Strauss syndrome, thrombohaemolytic thrombocytopenic purpura, leucoclastic vasculitis, and others

Diseases in adjacent structures

Myocardial infarction, aortic dissection, pneumonia, pulmonary embolism, empyema

Metabolic disorders

Uraemic, dialysis-related, myxoedema, gout, scurvy

Neoplastic disorders

Primary

Mesothelioma, sarcoma, fibroma, lipoma, and others

Secondary (metastatic or direct spread)

Carcinoma, lymphoma, carcinoid, and others

Trauma

Direct

Pericardial perforation (penetrating injury, oesophageal or gastric perforation) and cardiac injury (cardiac surgery, percutaneous procedures)

Indirect

Radiation, non-penetrating chest injury

Association with other syndromes

Postmyocardial and pericardial injury syndromes, inflammatory bowel disease, Loffler syndrome, Stevens-Johnson syndrome, giant-cell aortitis, hypereosinophilic syndromes, acute pancreatitis, others

Modified with permission from Spodick DH. Pericardial disease. In: Braunwald E, Zipes DP, Libby P, eds. Heart disease: a textbook of cardiovascular medicine, 6th edn. Philadelphia: WB Saunders, 2001 (reference 1).

Tedavi algoritminde

- 1) NSAİ ilk seçenek
- 2) Devam eden tablolarda (TB gibi); ileri inceleme ve KSD
- 3) Komplikasyon varsa;
-perikardiyosentez
-perikardiyektomi

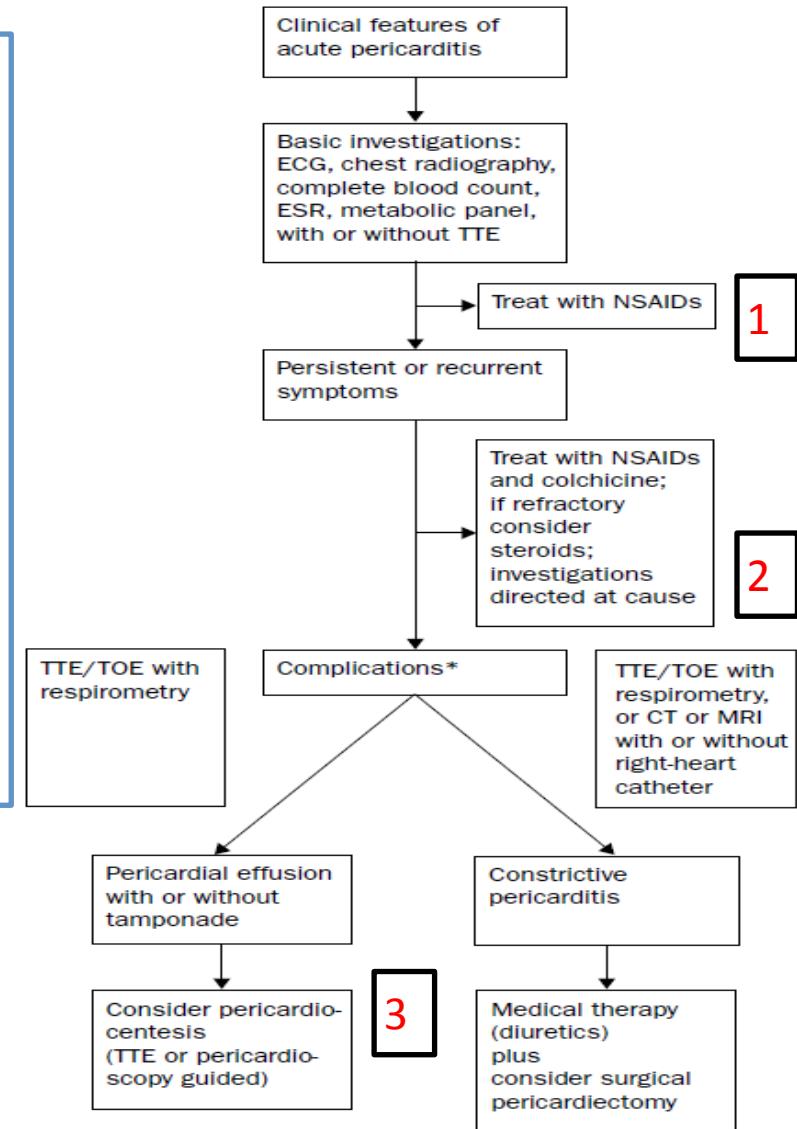

Figure 1: Suggested approach to investigation and management of pericarditis and its complications

TTE=transthoracic echo. TOE=transoesophageal echo. *Defined as haemodynamic instability, right-heart failure, volume overload, or both, or unexplained cardiovascular symptoms.

Rationale and design of the Investigation of the Management of Pericarditis (IMPI) trial: A 2×2 factorial randomized double-blind multicenter trial of adjunctive prednisolone and *Mycobacterium w* immunotherapy in tuberculous pericarditis

- TB Perikardit, Çok merkezli, çift randomize, çift körlü, prednisolon ve *Mycobacterium W* immunoterapi
- TB perikarditte mortalite ve kalıcı hasar %50'lerdedir,
- TB perikarditte efüzyon birikimini azaltıcı etkin olan KSD, immünoterapi (*M. w*) ile kıyaslanmıştır,
- TB perikardit tanılı/olası 1400 hasta,

Table I. Diagnostic criteria for TB pericarditis in a TB-endemic country or community²³

Diagnostic category	Criteria
Definite TB pericarditis	<ul style="list-style-type: none">• Tubercl bacilli are found in stained smear or culture of pericardial fluid; or
Probable TB pericarditis	<ul style="list-style-type: none">• Tubercl bacilli or caseating granulomata are found on histologic examination of pericardium• Evidence of pericarditis in a patient with TB demonstrated elsewhere in the body; or• Lymphocytic pericardial exudate with elevated adenine deaminase activity; or• A Tygerberg TB Pericarditis Diagnostic Index Score ≥ 6 in patients in whom pericardiocentesis is not feasible, and other causes of pericarditis have been excluded

TB tanı:

- Perikardiyel sıvıda TB basili
- Perikard biyopsisinde TB basili veya kazeifikasyon granülomu

TB olası:

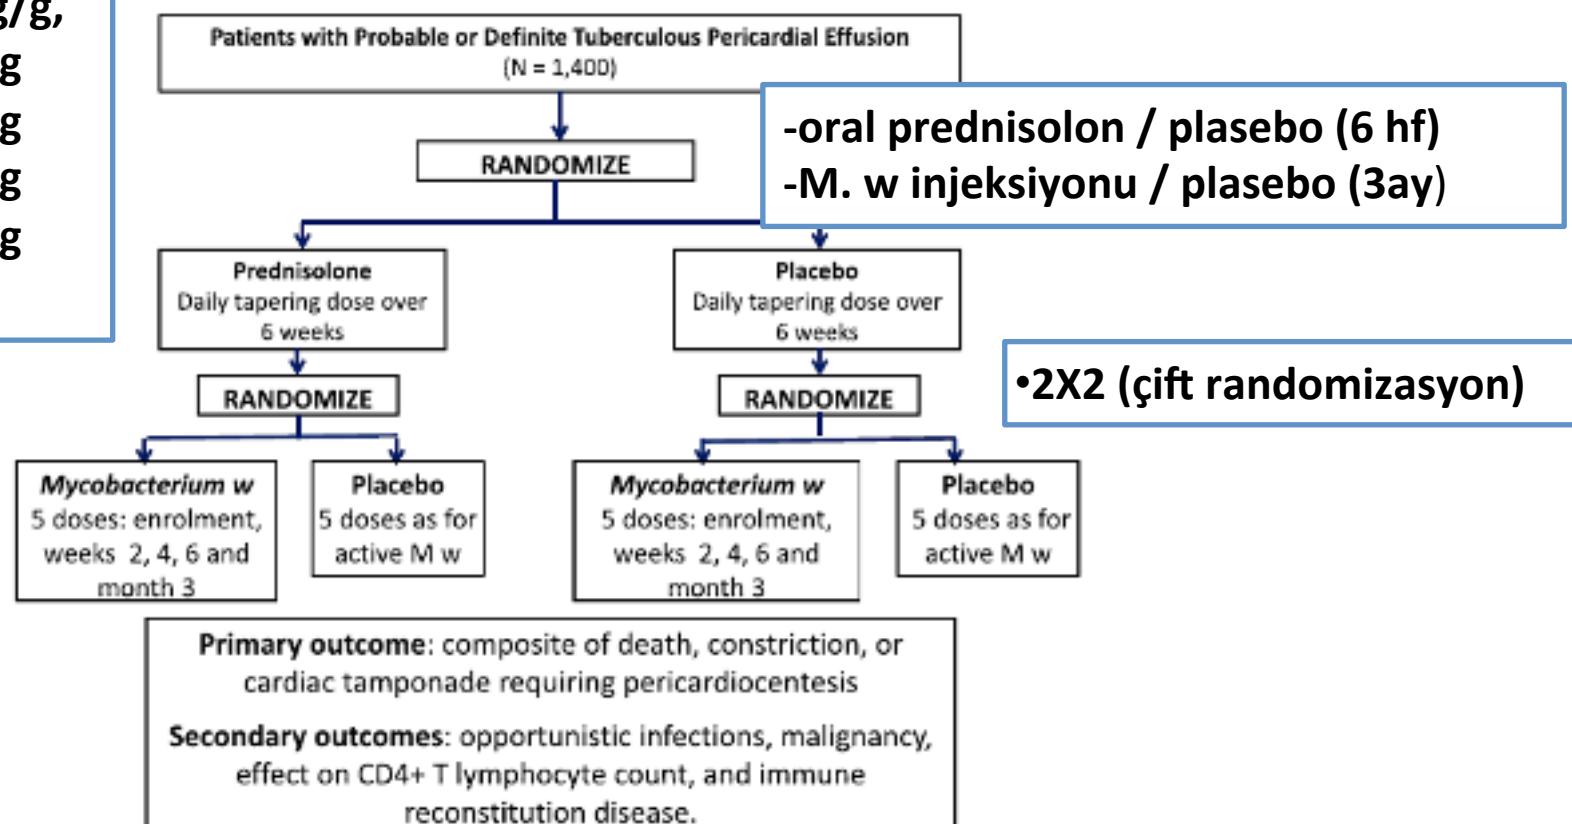

- Başka bir yerde TB tanısı konan perikardit veya
- Artmış lenfositik aktivite ile ADA pozitifliği
- Perikardiyosentez mümkün olmayan hastalarda Tygerberg skoru >6

Tygerberg TB perikardit Tanı Kriteri Puanı (>6)-perikardiyosentez yapılamayanlar

- Kilo kaybı (1)
- Gece terlemesi (1)
- Ateş (2)
- Serum globulin $>40\text{g/L}$ (3)
- BK sayısı $< 10 \times 10^9 / \text{L}$ (1)

- Prednisolon ve M. w immünoterapsinin tamponat ve perikardiyel drenaj gerektiren effüzyon gelişimi üzerine etkisi araştırıldı ve kıyaslandı,
- Randomize
 - oral prednisolon / placebo (6 hf)
 - M. w injeksiyonu / placebo (3ay)
- Takip
 - 2,4,6. hf
 - 3 ve 6. ay ve 6 aylık periyotlarla 4 yıl
- Primer sonlanım: ölüm/ perikardiyel kontrüksyon/ perikardiyosentez gerektiren tamponat
- Sekonder sonlanım:immünmodülasyonun olumsuz etkileri fırsatçı enfeksiyon (herpes zooster vb) veya malignite (kaposi vb)

- 1.hf; 120 mg/g,
- 2.hf; 90mg/g
- 3.hf; 60mg/g
- 4.hf; 30mg/g
- 5.hf; 15mg/g
- 6.hf; 5mg/g

IMPI Trial study design.

Primer sonlanım: ölüm/ perikardiyel kontrüksyon/perikardiyosentez gerektiren tamponat

Sekonder sonlanım:immünmodülasyonun olumsuz etkileri fırsatçı enfeksiyon (herpes zooster vb) veya malignite (kaposi vb)

4. Detectable RRR comparisons between the cell with double placebo versus each individual drug (2-tailed $\alpha = .0264$, 10% drop-out and 6% lost to follow-up)

Double placebo event rate	1200-patient study		1400-patient study		1600-patient study	
	n = 300 vs 300 cell comparison		n = 350 vs 350 cell comparison		n = 400 vs 400 cell comparison	
	80% power	90% power	80% power	90% power	80% power	90% power
35%	30.2%	34.0%	28.2%	31.8%	26.6%	30.0%
40%	28.9%	32.5%	27.0%	30.4%	25.4%	28.7%
45%	27.8%	31.3%	26.0%	29.3%	24.5%	27.6%

- Sonuç:

- KSD ve M. w immünizasyonu TB perikarditte anti TB tedaviye yardımcıdır,
- KSD'lerin etkisi daha erken çıkmaktadır,
- İmmünoterapinin etkisi daha uzun sürmekte ve tekrarlayan effüzyona etkisi daha güçlündür,

TB cilt tutulumu-sınıflama-I

- Eksojen kaynaktan inokülasyon
 - Primer cilt TB
 - Tuberculosis verrükosa cutis
- Otoinokülasyon veya endojen kaynaktan yayılım
 - Skrofuloderma
 - Tuberculosis cutis orificialis
 - Lupus vulgaris
- Hematojen yayılım
 - Lupus vulgaris
 - Akut miliyer TB
 - Metastatik TB absesi

TB cilt tutulumu sınıflama-II

Olgı:

- 67y E, çiftçi, oniki yıldır KOAH nedeniyle inhale kortikosteroid ve beta blokör kullanıyor.
- Sol bacak 1/3 distalinde üç haftadır devam eden ağrısız, fistülüze, üzeri yer yer nekrotik kurutlanma içeren ve pürülen akıntı sonrası tekrar kapanan yara (Resim 1).
- Farklı hekimlerce betalaktam ve beta laktamaz inhibitörü başlanması rağmen iyileşmiyor
- Aspirasyon direkt bakı ve kültüründe; her sahada bol lökosit ve eritrosit, gram negatif bakteri ve GSBL (+) *E.coli*
- Hastaya ertapenem 1x1 gr IV tedavi başlandı.
- Tedavinin üçüncü günü mikrobiyoloji laboratuvarından gelen sonuçlarda yara direkt bakısında 2-3 adet ARB basil görüldüğü bildirildi.
- HRZE, PO başlandı. Birinci ayda görünüm (Resim 2).

Management of cutaneous tuberculosis

Table 1. Recommended dosage for initial treatment of cutaneous tuberculosis

Drug	Daily dose	Thrice-Weekly dose	Children ^a
Isoniazid	5 mg/kg, max 300 mg	15 mg/kg, max 900 mg	10–15 mg/kg daily; 20–30 mg/kg intermittent
Rifampicin	10 mg/kg, max 600 mg	10 mg/kg, max 600 mg	10–20 mg/kg
Pyrazinamide	20–25 mg/kg, max 2 g	30–40 mg/kg, max 3 g	
Ethambutol	15–20 mg/kg	25–30 mg/kg	

^aDosage for children is similar, except that some authorities recommend higher doses of isoniazid and rifampicin.

Source: Based on American Thoracic Society, Infectious Disease Society of America and Centers for Disease Control and Prevention.

HRZE başlangıç tedavisi (2 ay) ve HR (4 ay) (AC TB ile aynı)

TB cilt tutulumu-tedavi

Table 2. Treatment regimen for cutaneous tuberculosis

Chemotherapy	First-line drugs	Resistance to isoniazid	Resistance to isoniazid and rifampicin	Resistance to all first-line drugs
Initial or bactericidal phase	Rifampicin + isoniazid + pyrazinamide + streptomycin or ethambutol 2 months, daily	Rifampicin + pyrazinamide + ethambutol ^a	Pyrazinamide + ethambutol + quinolone antibiotic Streptomycin (or another injectable agent ^b)	1 injectable agent ^b + 3 of the following: ethionamide, cycloserine, quinolone antibiotic, para-aminosalicylic acid
Continuation or sterilizing phase	Rifampicin + Isoniazid 4 months, daily 2/week or 3/week	Throughout (6 months)	Throughout (18–24 months)	Throughout (24 months)
Total duration of therapy	6 months at least	6 months	18–24 months	24 months

^aA fluoroquinolone may strengthen the regimen for patients with extensive disease.

^bAmikacin, kanamycin, or capreomycin. All agents should be discontinued after 2–6 months, depending upon tolerance and response.

- Toplam tedavi süresi 6 ay
- H direncinde; RZE, 6 ay
- HR direncinde; ZE+FQ / S, 18-24 ay
- Tüm birinci basamaklara direnç; S (enjektabl amicasin/kanamisin/kapreomisin)+ 3'lü (sikloserin, etionamid, FQ, PAS), 24 ay

TABLE 2. Drug regimens for culture-positive pulmonary tuberculosis caused by drug-susceptible organisms

Regimen	Drugs	Initial phase Interval and doses [‡] (minimal duration)	Continuation phase		Range of total doses (minimal duration)	Rating ^a (evidence) [†]		
			Regimen	Drugs		HIV ⁻	HIV ⁺	
1	INH	Seven days per week for 56 doses	1a	INH/RIF	Seven days per week for 126 doses (18 wk) or 5 d/wk for 90 doses (18 wk) [¶]	182–130 (26 wk)	A (I)	A (II)
	RIF	(8 wk) or 5 d/wk for 40 doses		INH/RIF	Twice weekly for 36 doses (18 wk)	92–76 (26 wk)	A (I)	A (II) [#]
	PZA	(8 wk) [¶]	1c**	INH/RPT	Once weekly for 18 doses (18 wk)	74–58 (26 wk)	B (I)	E (I)
2	EMB							
	INH	Seven days per week for 14 doses (2 wk), then twice weekly for 12 doses (6 wk) or 5 d/wk for 10 doses (2 wk), [¶] then twice weekly for 12 doses (6 wk)	2a	INH/RIF	Twice weekly for 36 doses (18 wk)	62–58 (26 wk)	A (II)	B (II) [#]
	RIF		2b**	INH/RPT	Once weekly for 18 doses (18 wk)	44–40 (26 wk)	B (I)	E (I)
	PZA							
3	EMB							
	INH	Three times weekly for 24 doses (8 wk)	3a	INH/RIF	Three times weekly for 54 doses (18 wk)	78 (26 wk)	B (I)	B (II)
	RIF							
	PZA							
4	EMB							
	INH	Seven days per week for 56 doses	4a	INH/RIF	Seven days per week for 217 doses (31 wk) or 5 d/wk for 155 doses (31 wk) [¶]	273–195 (39 wk)	C (I)	C (II)
	RIF	(8 wk) or 5 d/wk for 40 doses	4b	INH/RIF	Twice weekly for 62 doses (31 wk)	118–102 (39 wk)	C (I)	C (II)
	EMB	(8 wk) [¶]						

Definition of abbreviations: EMB = Ethambutol; INH = Isoniazid; PZA = pyrazinamide; RIF = rifampin; RPT = rifapentine.

* Definitions of evidence ratings: A = preferred; B = acceptable alternative; C = offer when A and B cannot be given; E = should never be given.

† Definition of evidence ratings: I = randomized clinical trial; II = data from clinical trials that were not randomized or were conducted in other populations; III = expert opinion.

‡ When DOT is used, drugs may be given 5 days/week and the necessary number of doses adjusted accordingly. Although there are no studies that compare five with seven daily doses, extensive experience indicates this would be an effective practice.

§ Patients with cavitation on initial chest radiograph and positive cultures at completion of 2 months of therapy should receive a 7-month (31 week; either 217 doses [daily] or 62 doses [twice weekly]) continuation phase.

¶ Five-day-a-week administration is always given by DOT. Rating for 5 day/week regimens is A (II).

Not recommended for HIV-infected patients with CD4⁺ cell counts <100 cells/ μ L.

** Options 1c and 2b should be used only in HIV-negative patients who have negative sputum smears at the time of completion of 2 months of therapy and who do not have cavitation on initial chest radiograph (see text). For patients started on this regimen and found to have a positive culture from the 2-month specimen, treatment should be extended an extra 3 months.

5.2.1. Six-month regimens

The current minimal acceptable duration of treatment for all children and adults with culture-positive tuberculosis is 6 months (26 weeks). The initial phase of a 6-month regimen for adults should consist of a 2-month period of INH, RIF, PZA, and EMB given daily throughout (Regimen 1), daily for 2 weeks followed by two times weekly for 6 weeks (Regimen 2), or three times a week (Regimen 3). The minimum

- Optimum tedavi HRZE (2 ay), HR(4 ay) toplamda 6 ay (26hf) olmalı

5.2.2. Nine-month regimen

If PZA cannot be included in the initial regimen, or if the isolate is determined to be resistant to PZA (an unusual circumstance, except for *Mycobacterium bovis* and *M. bovis* var. BCG), a regimen consisting of INH, RIF, and EMB should be given for the initial 2 months (Regimen 4) followed by INH and RIF for 7 months given either daily or twice weekly (Regimens 4a and 4b).

- Eğer PZA başlanamıyorsa veya direnç varsa; HRE(2 ay) sonrasında HR (7 ay), toplamda 9 ay olmalı

8. Treatment in Special Situations

8.1. HIV Infection

Tuberculosis and HIV Infection

The treatment of tuberculosis in persons with HIV infection is essentially the same as for patients without HIV infection. There are two important exceptions to this generalization: 1) Once weekly INH–rifapentine in the continuation phase should not be used in any HIV-infected patient; and 2) twice weekly INH–RIF or rifabutin should not be used for patients with CD4⁺ lymphocyte counts less than 100/ μ l. Providers must be alert to the potential for interactions among many of the antiretroviral drugs and the rifamycins. Paradoxical reactions that mimic worsening of tuberculosis are more common in patients with HIV infection and may complicate therapy.

HIV (+)'lerde;
-INH-rifapentine /hf devamda
kullanılmamalı
-INH-RIF/ rifabutin / 2kez /hf,
100<CD4 olanlarda
kullanılmamalı

8.3. Extrapulmonary Tuberculosis

randomized controlled trials, suggests that 6- to 9-month regimens that include INH and RIF are effective (2–16). Therefore, among patients with extrapulmonary tuberculosis, a 6- to 9-month regimen (2 months of INH, RIF, PZA, and EMB followed by 4–7 months of INH and RIF) is recommended as initial therapy unless the organisms are known or strongly suspected of being resistant to the first-line drugs. If PZA cannot be used in the initial phase, the continuation phase must be increased to 7 months, as described for pulmonary tuberculosis.

The exception to the recommendation for a 6- to 9-month regimen is tuberculous meningitis, for which the optimal length of therapy has not been established, but some experts recommend 9–12 months.

Corticosteroid treatment is a useful adjunct in treating some forms of extrapulmonary tuberculosis, specifically meningitis and pericarditis caused by drug-susceptible organisms. Evidence-based recommendations on the duration of treatment for extrapulmonary tuberculosis and the use of corticosteroids are shown in Table 13.

AD-TB;

- 6-9 arası rejimler önerilir,
- 2 ay HRZE, 4-7 ay HR,
- PZA başlanamazsa; devam fazı 7 aya uzatılır,

TB-menenjitte toplam süre 9-12 ay olmalıdır

KSD tedavisi menenjit ve perikarditte anti TB tedaviye ek olarak önerilir.

TABLE 13. Evidence-based* guidelines for the treatment of extrapulmonary tuberculosis and adjunctive use of corticosteroids[†]

Site	Length of therapy (mo)	Rating (duration)	Corticosteroids [‡]	Rating (corticosteroids)
Lymph node	6	AI	Not recommended	DIII
Bone and joint	6–9	AI	Not recommended	DIII
Pleural disease	6	AII	Not recommended	DI
Pericarditis	6	AII	Strongly recommended	AI
CNS tuberculosis including meningitis	9–12	BII	Strongly recommended	AI
Disseminated disease	6	AII	Not recommended	DIII
Genitourinary	6	AII	Not recommended	DIII
Peritoneal	6	AII	Not recommended	DIII

* For rating system, see Table 1.

† Duration of therapy for extrapulmonary tuberculosis caused by drug-resistant organisms is not known.

‡ Corticosteroid preparations vary among studies. See Section 8.3 for specific recommendations.

KSD tedavisi konusunda bu iki tablo dışında yararını gösterir etkin çalışma yoktur

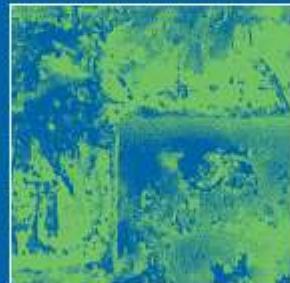

Tedavi süreleri açısından bakıldığında ;
 -Lenf nodu TB; 6 ay
 -Kemik-eklem TB; 6-9 ay
 -Perikardiyel TB; 6 ay
 -Genitoüriner TB; 6 ay
 -Peritoneal TB; 6 ay

SSS –TB açısından 9-12ay önerilen sürenin kanıt düzeyi daha düşük

TREATMENT OF TUBERCULOSIS

guidelines

FOURTH EDITION

WHO Library Cataloguing-in-Publication Data:

Treatment of tuberculosis: guidelines – 4th ed.

WHO/HTM/TB/2009.420

Treatment of extrapulmonary TB and of TB in special situations

Pulmonary and extrapulmonary disease should be treated with the same regimens (see Chapter 3).¹ Note that some experts recommend 9–12 months of treatment for TB meningitis (2, 3) given the serious risk of disability and mortality, and 9 months of treatment for TB of bones or joints because of the difficulties of assessing treatment response (3). Unless drug resistance is suspected, adjuvant corticosteroid treatment is recommended for TB meningitis and pericarditis (1–4). In tuberculous meningitis, ethambutol should be replaced by streptomycin.

- AC ve AD-TB'da tedavi seçenekleri aynıdır,
- Ana farklılıklar tedavi süresindedir,

- TB menenjitte ve kemik eklem TB'unda >9 ay tedavi süreleri önerilir,
- TB perikardit ve TB menenjitte ilaç dirençli TB şüphesi olmadığı sürece KSD tedavi eklenebilir,
- TB menenjitte ETM, Streptomisinle değiştirilmelidir,

TREATMENT OF TUBERCULOSIS: GUIDELINES

Although sometimes required for diagnosis, surgery plays little role in the treatment of extrapulmonary TB. It is reserved for management of late complications of disease such as hydrocephalus, obstructive uropathy, constrictive pericarditis and neurological involvement from Pott's disease (spinal TB). For large, fluctuant lymph nodes that appear to be about to drain spontaneously, aspiration or incision and drainage appear beneficial (3).

Tanı için bazen gerekli olsa da; cerrahinin yeri AD-TB'da sınırlıdır. Hidrosefali, obstrüktif üropati, konstriktif perikardit ve Pott hastalığı (spinal TB) nörolojik tutulumu için rezervde tutulmalıdır. Büyük lenf nodlarında da yararlıdır.

Tuberculosis

Clinical diagnosis and management of tuberculosis, and measures for its prevention and control

Eve Gidecek Mesajlar

'Sapientia est potentia'

Bilgelik güçtür

- AD-TB tedavisinde
 - İlaç duyarlı etken varlığında 6HRZE uygulanır,
 - Eğer başlangıçta Z başlanamıyorsa toplam tedavi 9 aya uzatılır,
 - İlaç dirençli etken varlığında duyarlılığa göre seçilir ve süre >18 ay,
 - KSD tedavisi sadece perikardit ve menenjit EII ve EIII'te yararlıdır,
 - SSS ve Kemik-Eklem TB tedavi süresi >9ay
 - SSS-TB'da E yerine S kullanılmalıdır

Eve Gidecek Mesajlar
'Sapientia est potentia'
Bilgelik güçtür

- Cerrahi tedavi sadece özel durumlarda uygulanır;
 - Hidrosefali,
 - Obstüriktif üropati,
 - Konstriktif perikardit,
 - Pott hastalığı (spinal TB) nörolojik bulgular varlığında,
 - Büyük lenf nodları(?)
 - Tüberkülom(?)
